## Deterministic Nonperiodic Flow<sup>1</sup>

EDWARD N. LORENZ

*Massachusetts Institute of Technology*

(Manuscript received 18 November 1962, in revised form 7 January 1963)

### ABSTRACT

Finite systems of deterministic ordinary nonlinear differential equations may be designed to represent forced dissipative hydrodynamic flow. Solutions of these equations can be identified with trajectories in phase space. For those systems with bounded solutions, it is found that nonperiodic solutions are ordinarily unstable with respect to small modifications, so that slightly differing initial states can evolve into considerably different states. Systems with bounded solutions are shown to possess bounded numerical solutions.

A simple system representing cellular convection is solved numerically. All of the solutions are found to be unstable, and almost all of them are nonperiodic.

The feasibility of very-long-range weather prediction is examined in the light of these results.

## Edward N. Lorenz, J. Atmos. Sci 1963

- Finite systems of **deterministic ordinary nonlinear differential equations** may be designed to represent forced dissipative hydrodynamic flow...
- For those systems **with bounded solutions** it is found that **nonperiodic solutions** are ordinary unstable with respect to small modifications, so that slightly differing initial states can evolve into considerably different states.

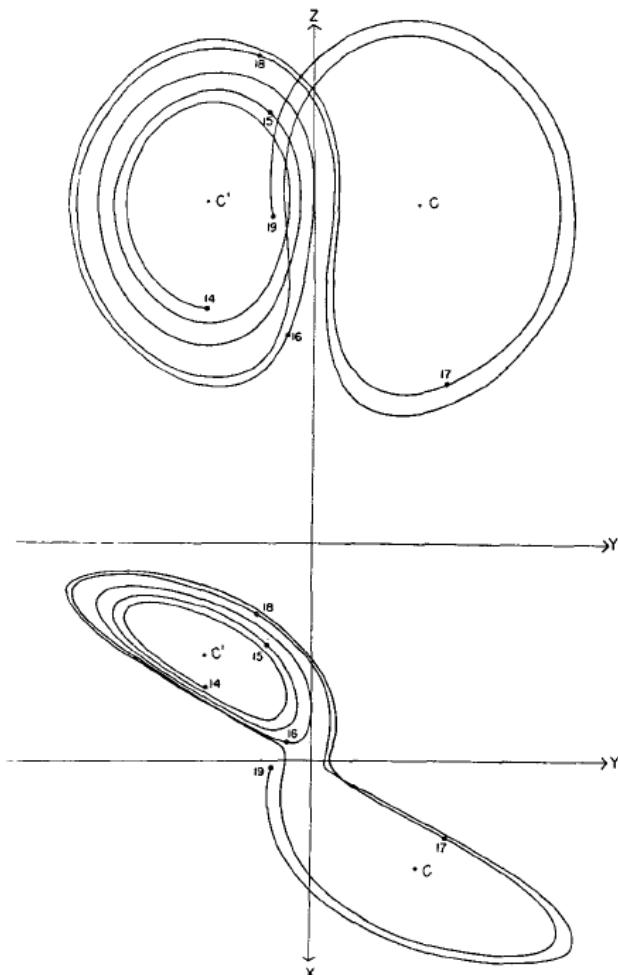

FIG. 2. Numerical solution of the convection equations. Projections on the  $X$ - $Y$ -plane and the  $Y$ - $Z$ -plane in phase space of the segment of the trajectory extending from iteration 1400 to iteration 1900. Numerals "14," "15," etc., denote positions at iterations 1400, 1500, etc. States of steady convection are denoted by  $C$  and  $C'$ .

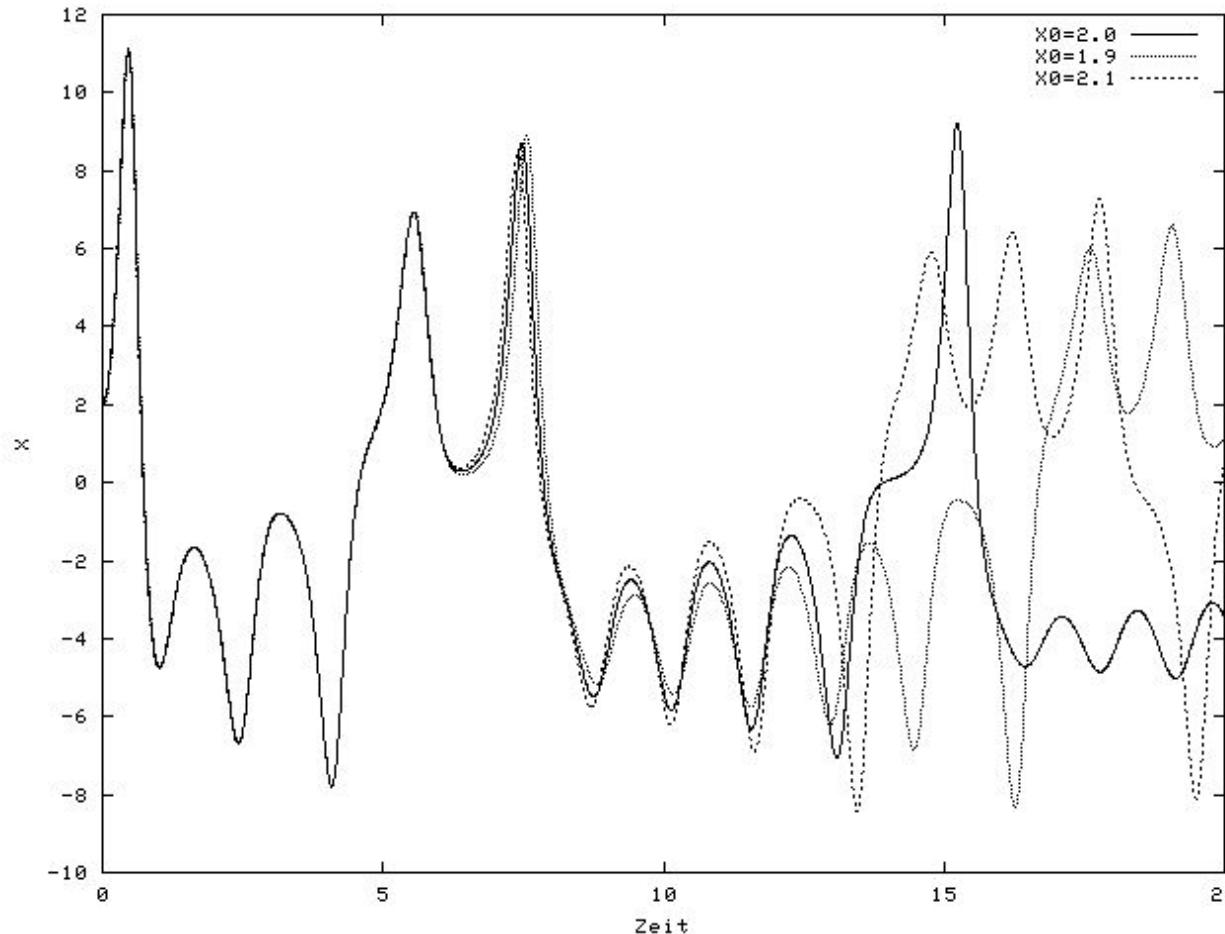

TABLE 2. Numerical solution of the convection equations  
Values of  $X$ ,  $Y$ ,  $Z$  are given at every iteration  $N$  for which  $Z$  possesses a relative maximum, for the first 6000 iterations.

## Need for probabilistic short range numerical weather predictions Simulated Radar reflectivity, 6 forecasts, same lead time

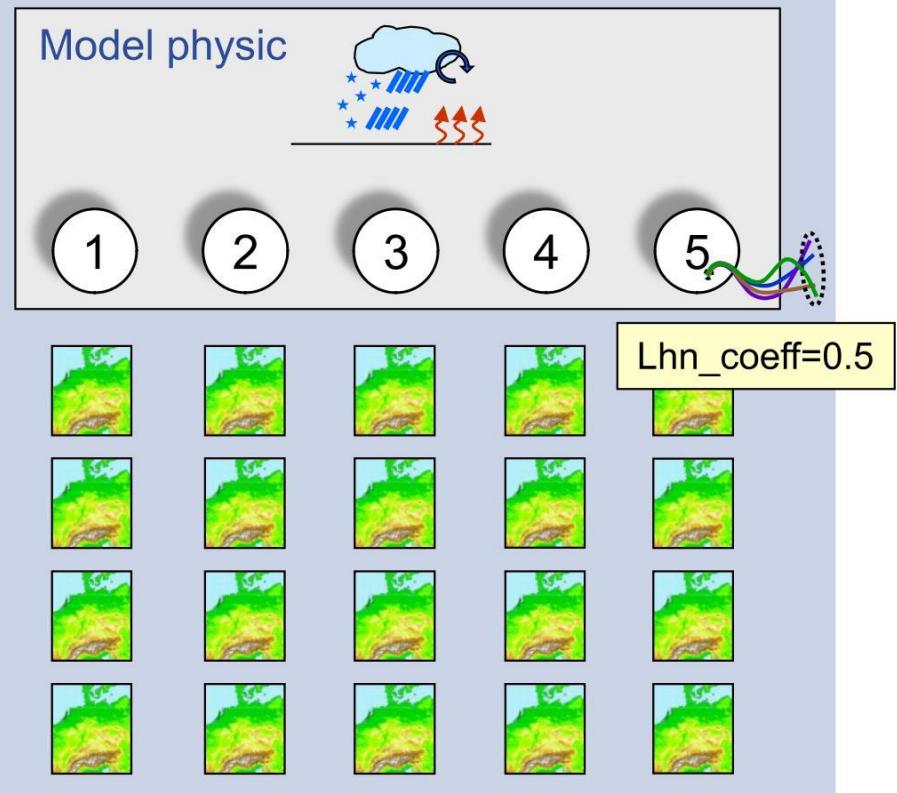

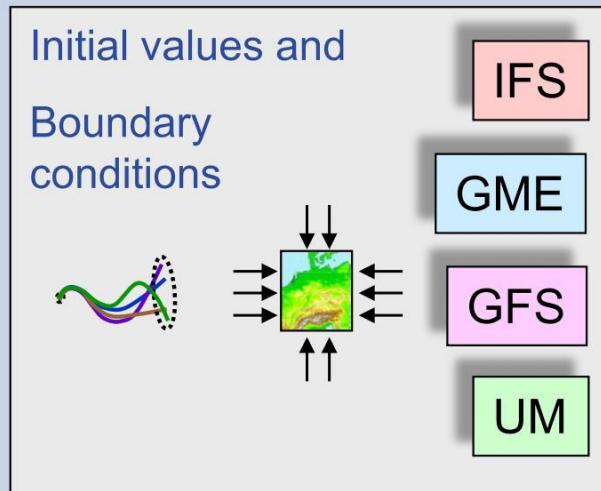

Lagged average ensemble with deep convection permitting model COSMO-DE of DWD

# Ensemble members in the experimental COSMO-EPS

Variation in the forecast system:

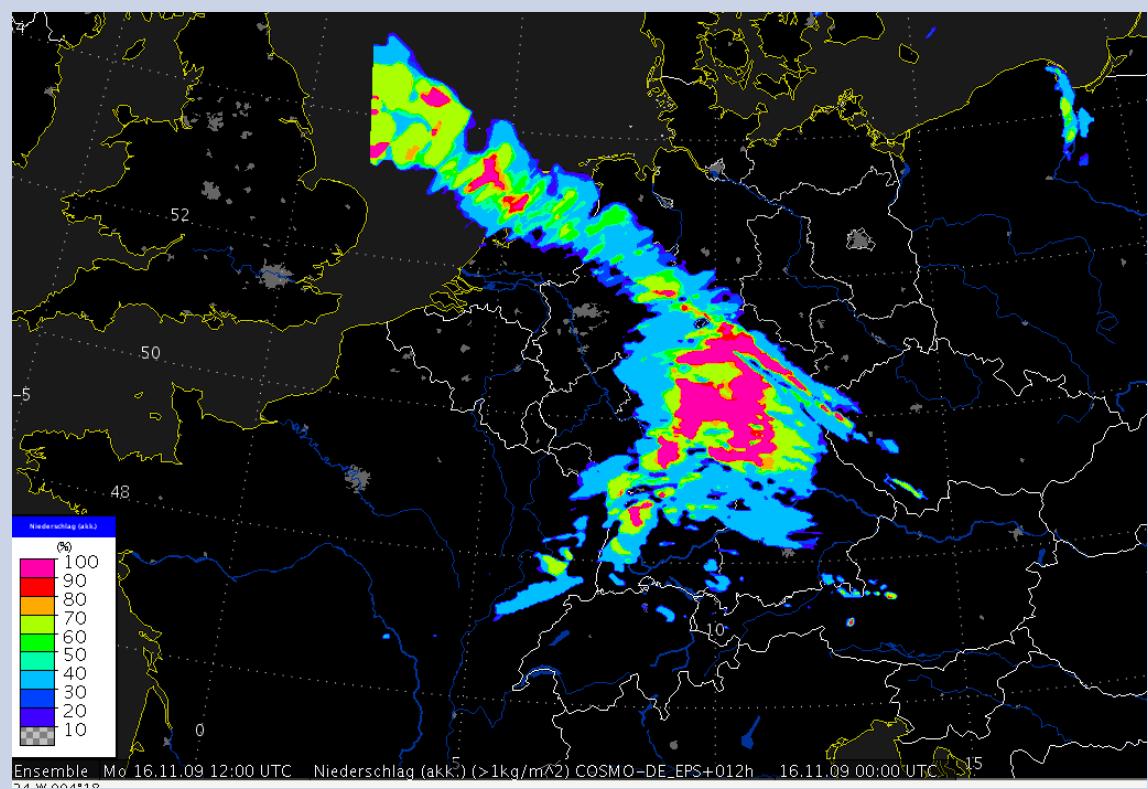

**20 Ensemble Member**

(plan to run a global EPS for short range predictions)

# Visualisation

example:  
Probability  
precipitation > 1 mm

# Actual developments in components of NWP systems

- Increasing resolution
  - Accuracy of the representation of processes in the atmosphere relevant for weather
  - Direct simulation of all relevant processes
- Need for new global nonhydrostatic models
  - compressible, nonhydrostatic model formulations successfully tested in limited area models
- ICON project – collaboration DWD with MPI for Meteorology
- Data assimilation

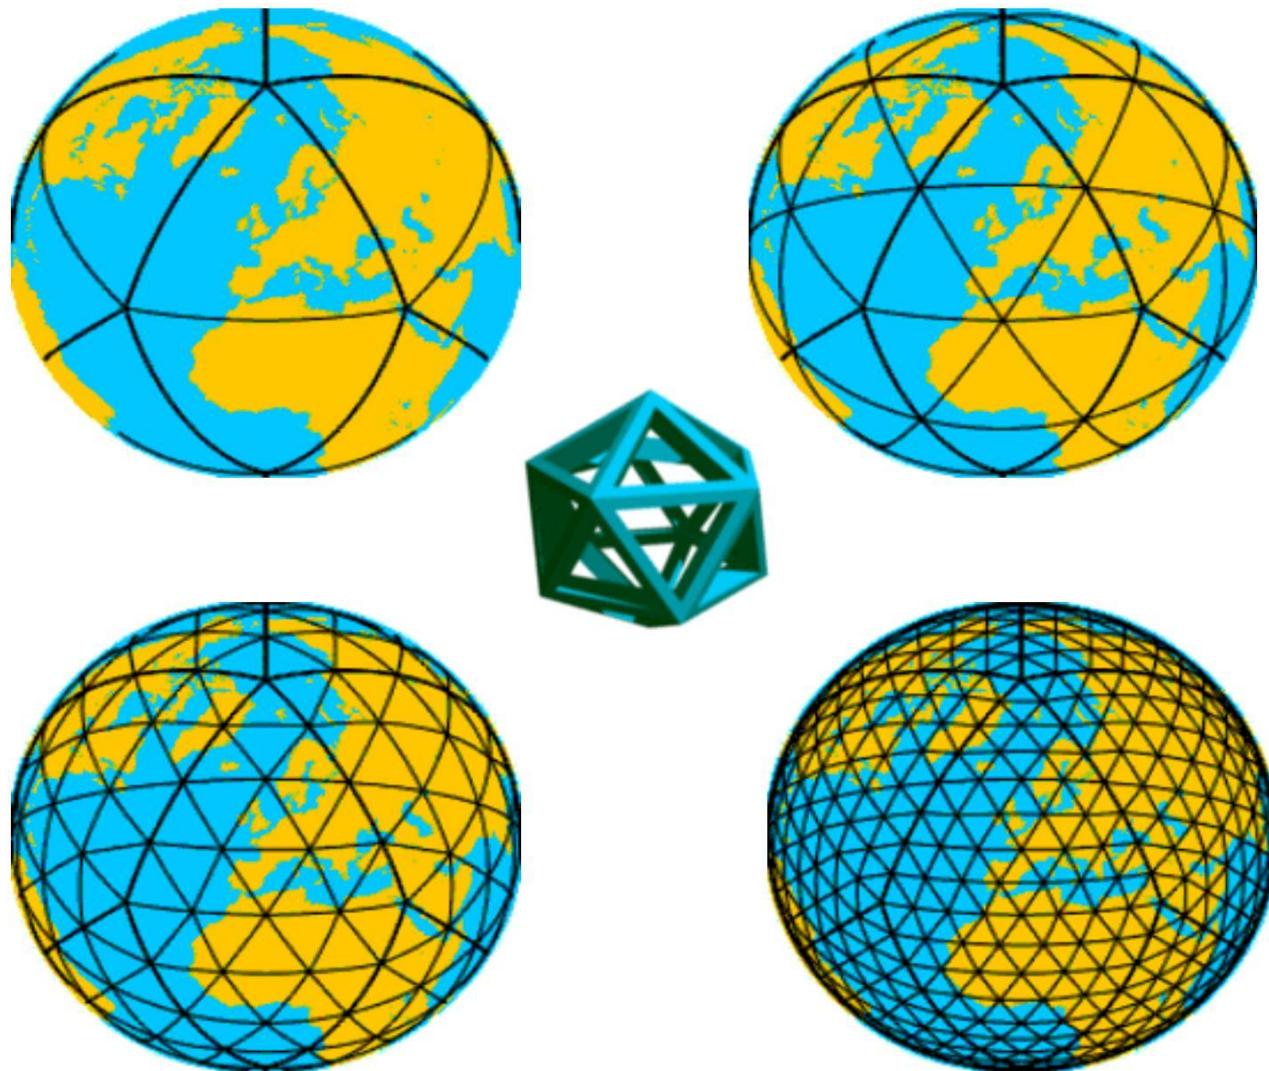

## Requirements for next generation global models

- Applicability on a wide range of scales in space and time  
in a modular way → „seamless prediction“
- Integration of the fully compressible (non-hydrostatic) equations of motion
- Deep atmosphere option
- (Static) mesh refinement and limited area model (LAM) option
- Scale adaptive physical parameterizations
- Conservation of at least mass and scalar quantities; what else: energy?
- Scalar transport consistent with the discrete mass conservation equation
- Positive definite transport for scalars; monotonicity?
- Scalability and efficiency on massively parallel computer systems with more than 10.000 to 100.000 cores
- Operators of at least 2<sup>nd</sup> order accuracy

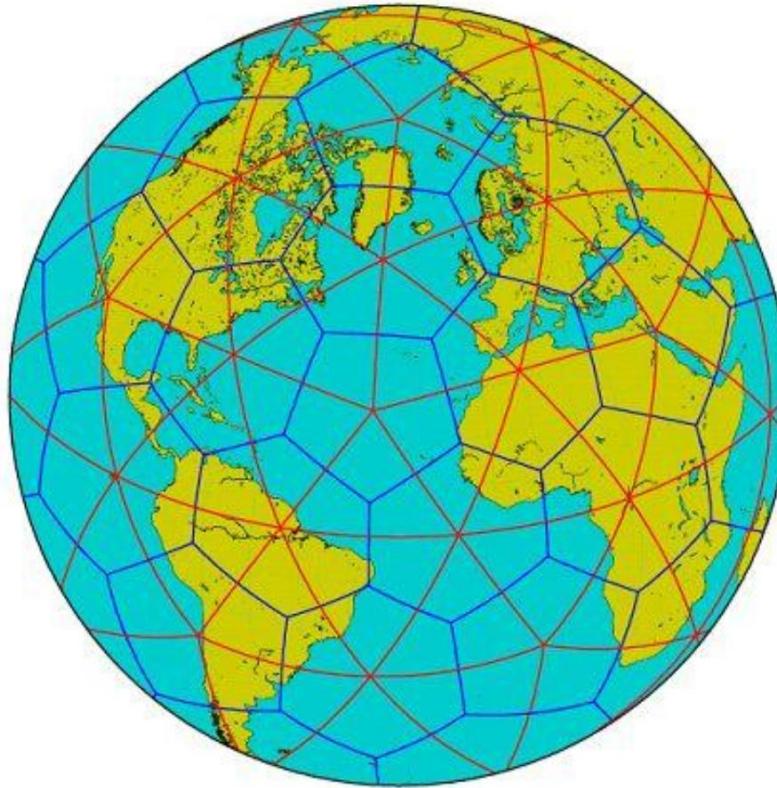

## The ICON-Project: Main Goals

- ➔ Centralize Know-how in the field of *global modelling* at DWD and the Max-Planck-Institute (MPI-M) in Hamburg.
- ➔ Develop a *non-hydrostatic global model with static local zooming option* (ICON: ICOsahedral Non-hydrostatic; <http://www.icon.enes.org/>).
- ➔ At DWD: Replace global model GME and regional model COSMO-EU by ICON with a high-resolution window over Europe. Establish a library of scale-adaptive physical parameterization schemes (to be used in ICON and COSMO-DE).
- ➔ At MPI-M: Use ICON as dynamical core of an Earth System Model (COSMOS); replace regional climate model REMO. Develop an ocean model based on ICON grid structures and operators.
- ➔ DWD and MPI-M: Contribute to operational seasonal prediction in the framework of the Multi-Model Seasonal Prediction System EURO-SIP at ECMWF).

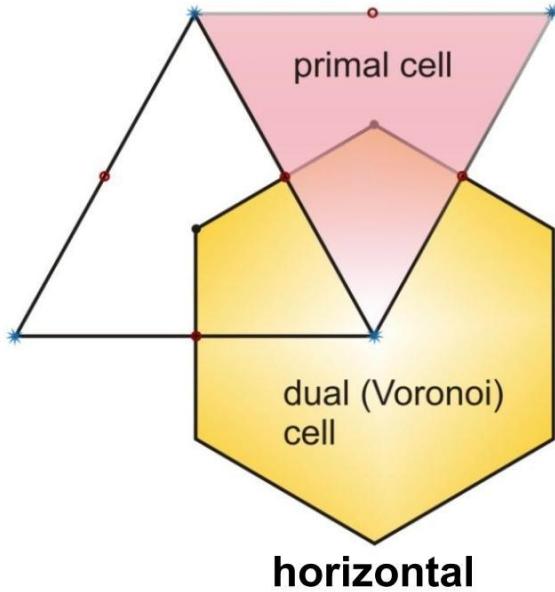

## Horizontal grid

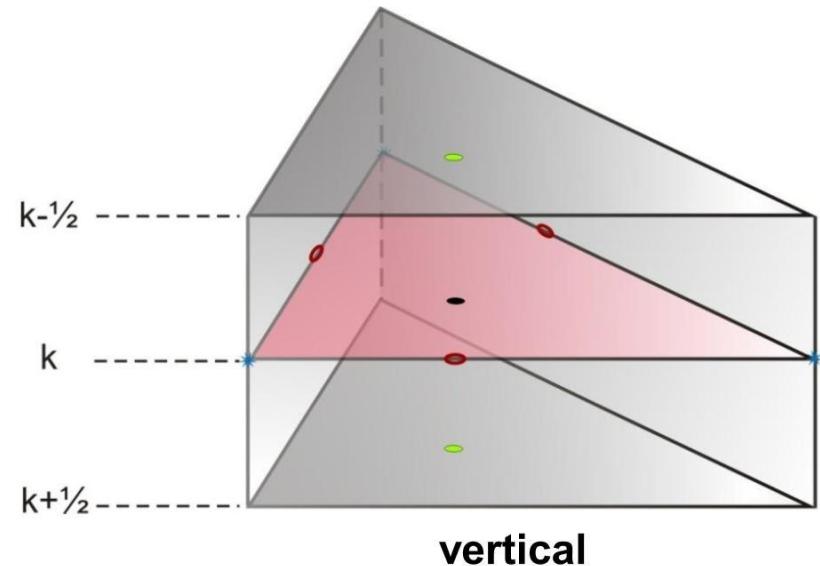

Primary (**Delaunay**, triangles) and dual grid (**Voronoi**, hexagons/pentagons)

## 3D-staggering of prognostic and diagnostic variables (hydrostatic core)

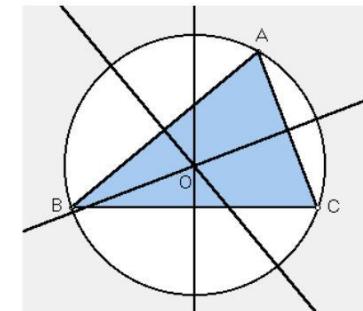

### C-type staggering

- $T, q, p, \Phi$
- $v_n$
- \*  $\vec{k} \cdot (\vec{\nabla} \times \vec{v})$
- $\dot{\eta} \frac{\partial p}{\partial \eta}, \Phi, p$

→ **Cell center:** center of triangle circumcircle

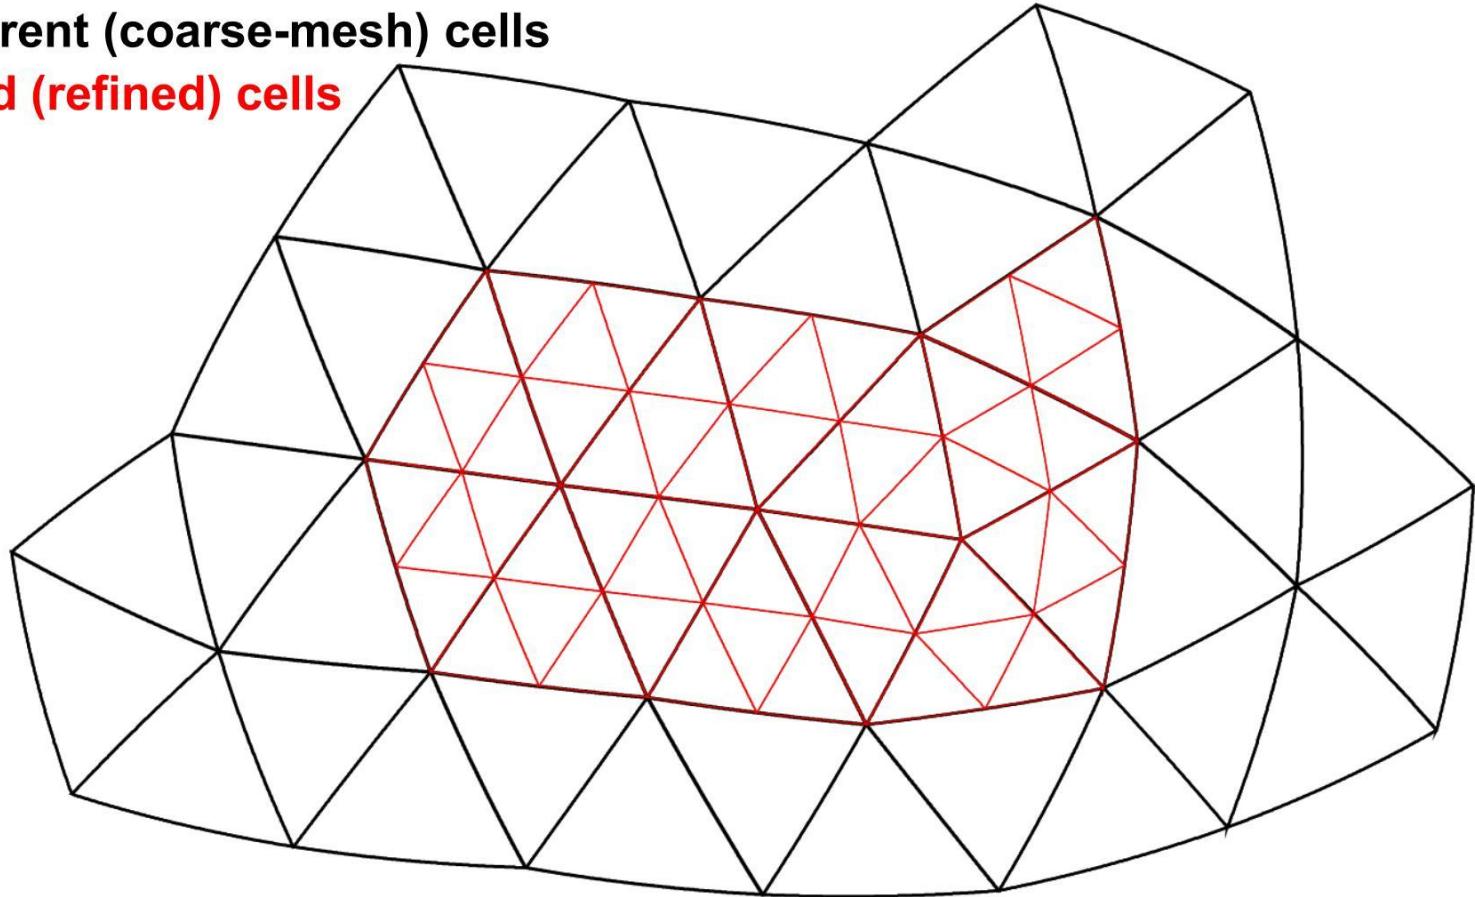

⇒ Arc connecting two mass points is orthogonal to and bisects triangle edge

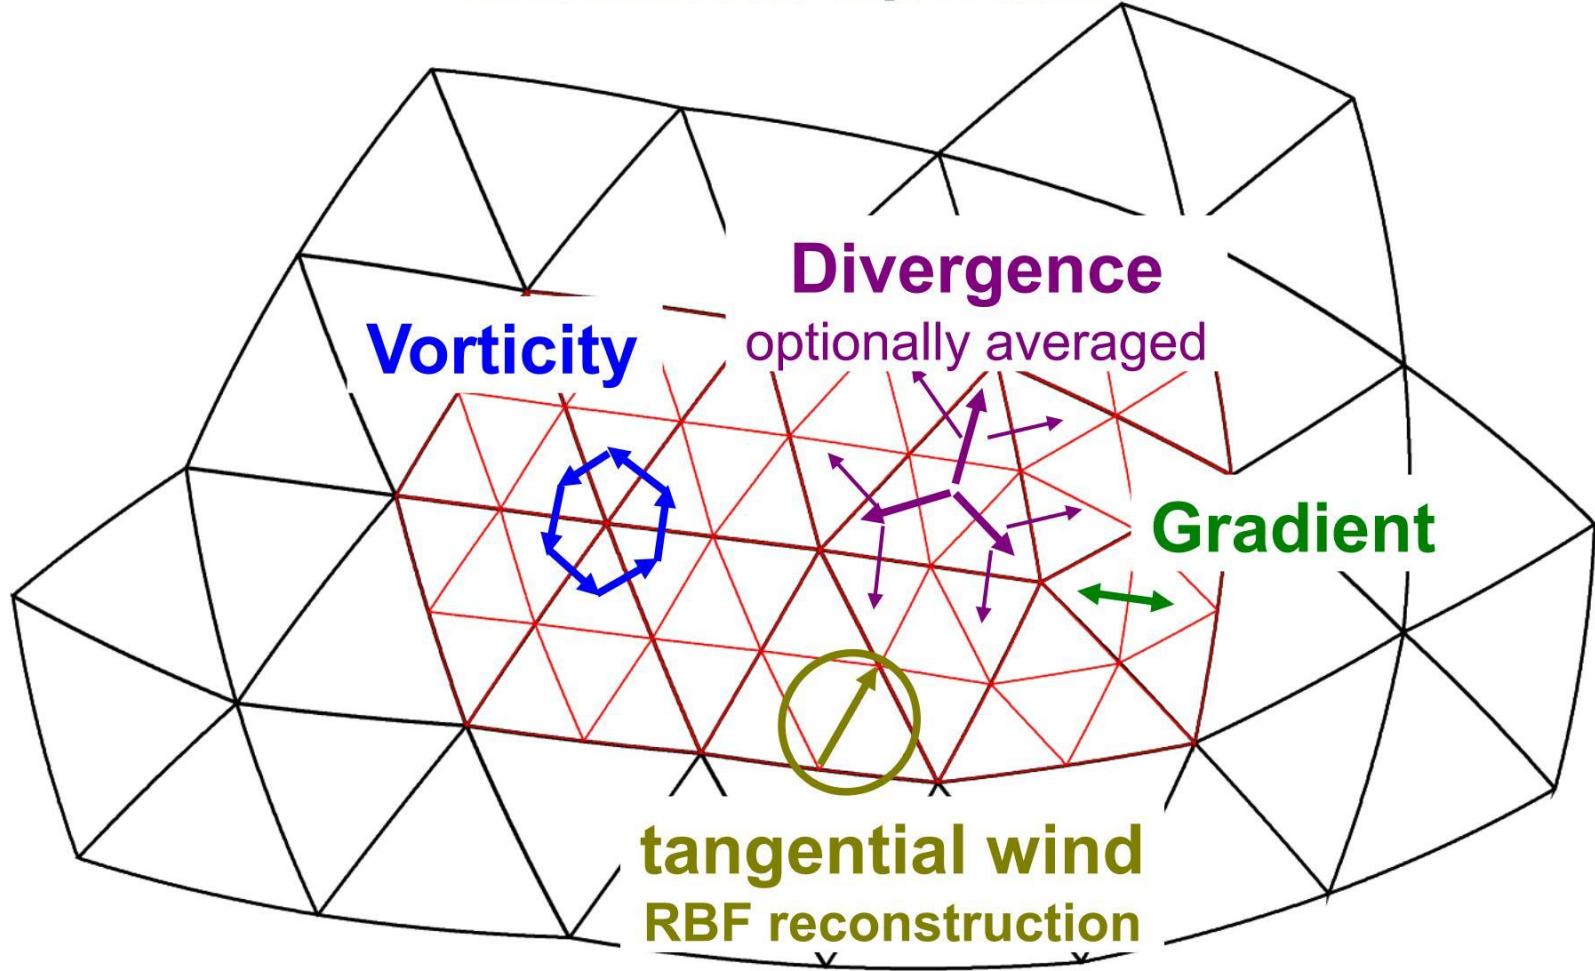

## Grid structure in the presence of (static) mesh refinement

Black triangles: parent (coarse-mesh) cells

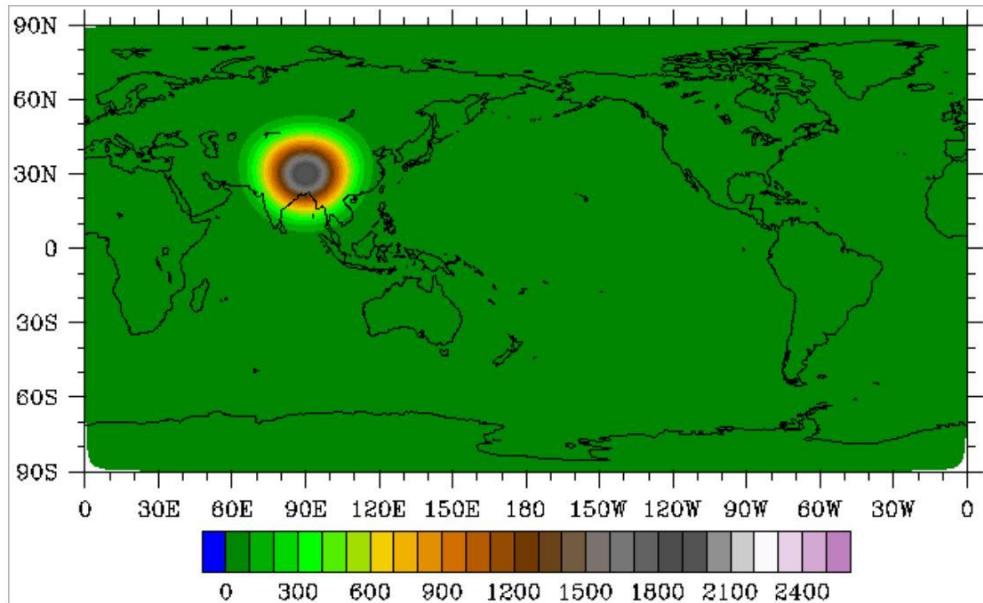

Red triangles: child (refined) cells

## Numerical Operators

## Demonstration example for grid nesting

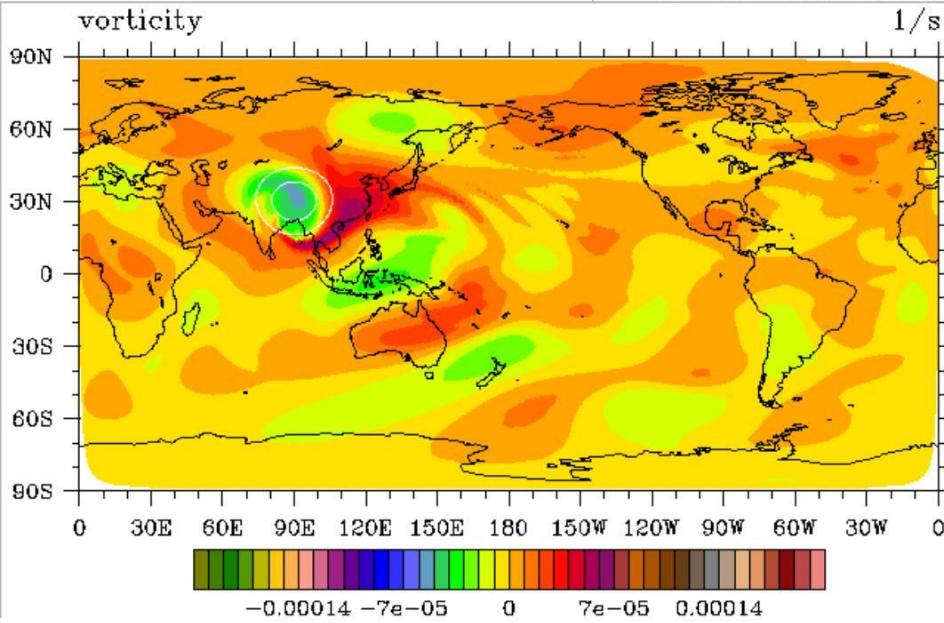

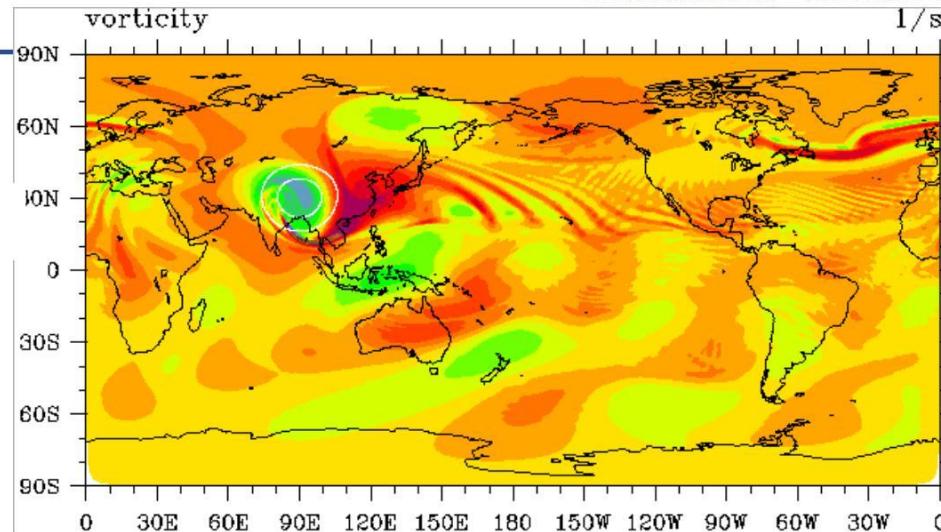

# Vorticity at lowest model level on day 20

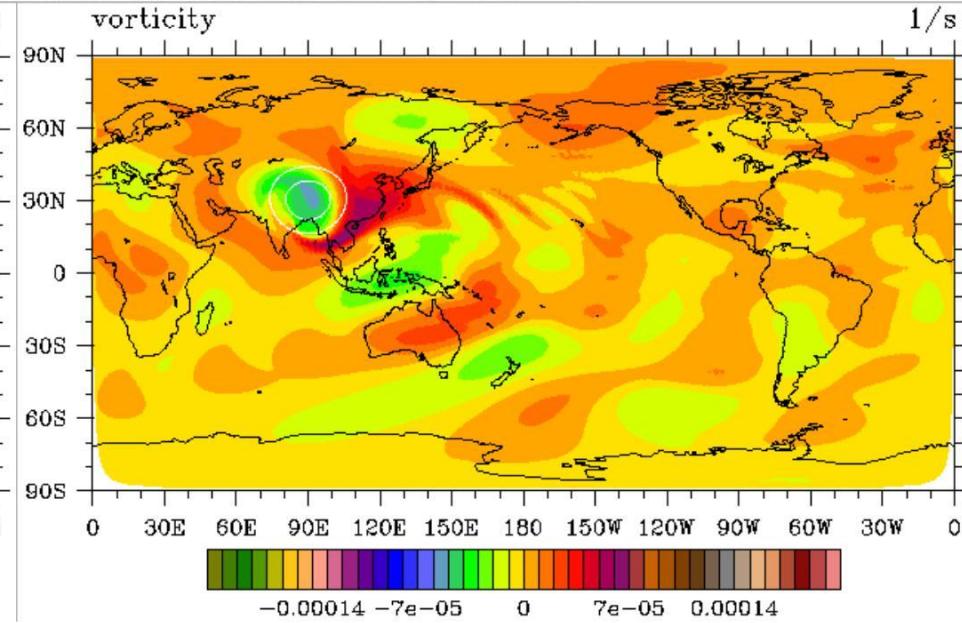

Deutscher Wetterdienst  
1/s · Hand

high-resolution (35 km)

coarse-resolution (140 km)

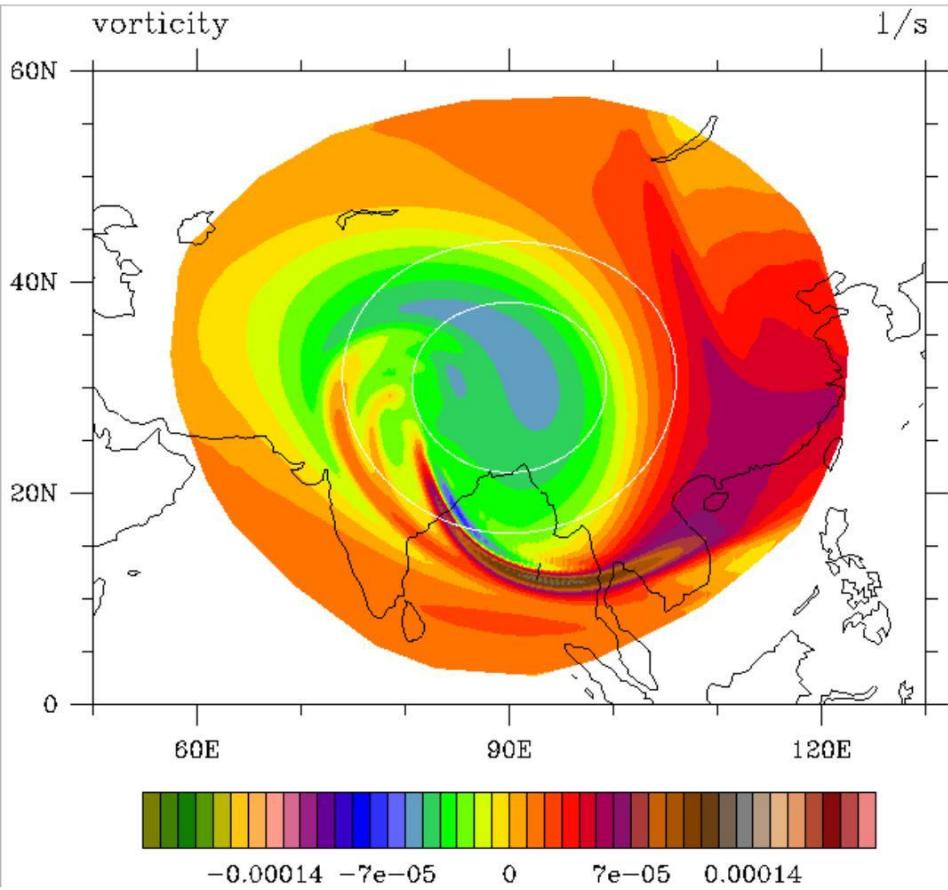

Nested (140 / 35 km)

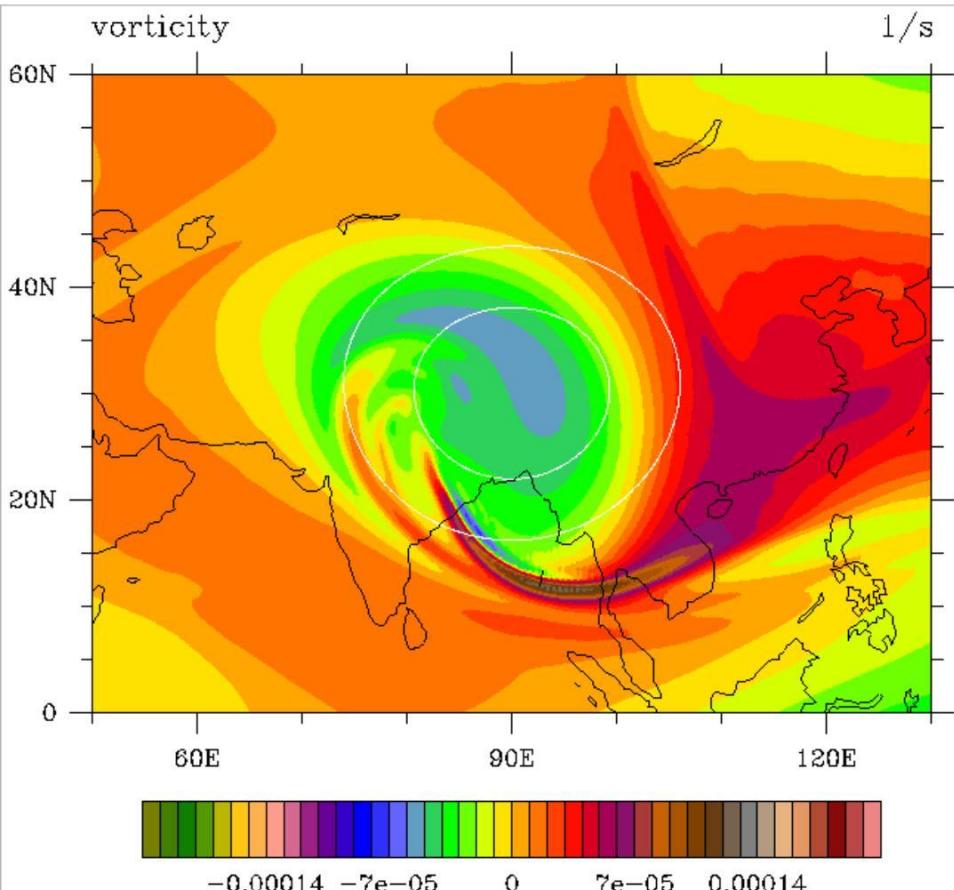

# Vorticity at lowest model level on day 20 (zoom)

Deutscher Wetterdienst  
Wetter und Klima aus einer Hand

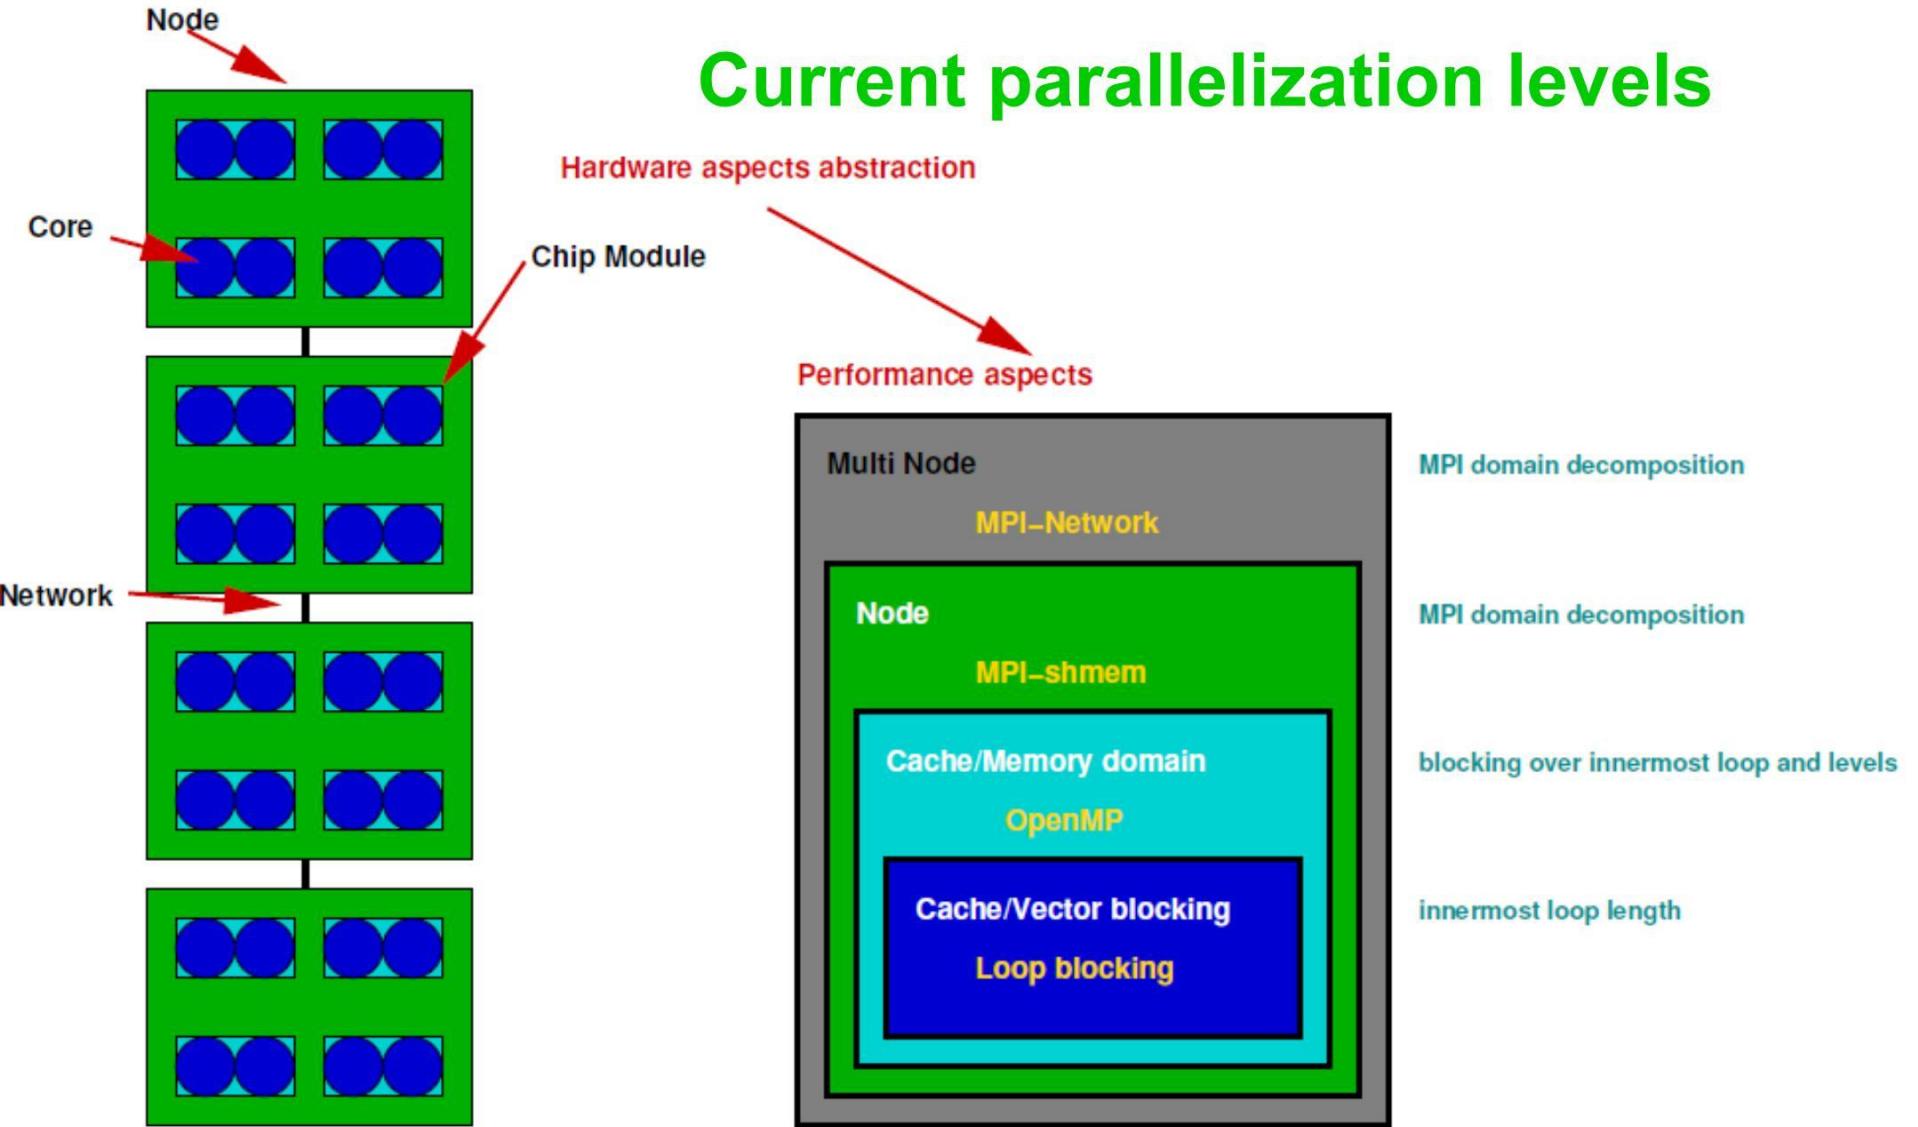

nested (innermost domain; 35 km)

high-resolution (35 km)

## Current parallelization levels

## Challenges

- Grid imprinting (“wave number 5 problem”) for icosahedral grids at lower horizontal resolutions.
- Proper balance between conservation, (local) accuracy and efficiency.
- Proper balance between portability (e.g. vector and scalar CPUs), efficiency and code maintenance.
- Scalability of I/O, esp. simulation results, on 10,000 or 100,000 cores.
- Use of GPUs (graphics processing units) to speed up calculations.

# Components of a data assimilation system

- Observation operator  $H$ :
  - Projection of the model state  $x$  on the observation  $y$  (simulator of the observation process)
- Observation error covariance  $\mathbf{O}$ :
  - Covariances between the errors of all observations
- Model error covariance  $\mathbf{B}$ :
  - Covariance between the errors of all degrees of freedom of the prediction system
  - $10^8$  degrees of freedom
- Variational problem with  $10^8$  variables
  - Most probable state of the atmosphere is defined by the minimum of

$$J(x) = (x - x_B)^T \mathbf{B}^{-1} (x - x_B) + (y_O - H(x))^T \mathbf{O}^{-1} (y_O - H(x))$$

## Recent Developments in data assimilation □ □

- Prediction of flow dependent model error covariance matrix **B**
  - by using the Ensemble of forecasts to approximate a Kalman filter process
- This requires an ensemble of data assimilations
  - which provides also the necessary initial values for the ensemble forecast system

## Summary

- The development of NWP systems still demands increasing computational ressources
  - Increasing resolution
  - Comprehensive physics
  - Ensemble prediction systems (EPS) on all scales
  - High resolution Ensemble data assimilation

A dark, abstract architectural structure with horizontal slats and a bright sun in the background.

12.8 GB/s per Link in each direction

Local memory bandwidth:  
25.6 GB/s (DDR3/1066 MHz)  
uni-directional

# Architecture of Nehalem (2)

L1-Cache	4 x 32 KB	2 words/cycle bi-directional
L2-Cache	4 x 256 KB	4 words/cycle uni-directional
L3-Cache	8 MB (shared)	1-4 words/cycle uni-directional
Memory	Up to 32 GB	$25.6/(20.24\ldots 80.96) = 0.31 - 1.26$ words/cycle

# Nehalem's architectural Efficiency

Peak performance of one core:  $4 * 2.53 = 10.12 \text{ Gflops}$

Architectural efficiency for full triad:  $\mathbf{c} = \mathbf{c} + \mathbf{a} * \mathbf{b}$  ( $\mathbf{a}, \mathbf{b}, \mathbf{c}$  are vectors)

Full Triad	Expected Theoretical Peak Performance	Architectural Efficiency
Data from L1-cache	$10.12 / 2 = 5.06 \text{ Gflops}$	0.5
Data from L2-cache	$10.12 / 2 = 5.06 \text{ Gflops}$	0.5
Data from L3-cache	$10.12 / 2 \dots 8 = 1.26 - 5.06 \text{ Gflops}$	0.125 – 0.5
Data from memory	$10.12 * (0.31 \dots 1.26)/4 = 0.79 - 3.18 \text{ Gflops}$	0.08 – 0.315

Architectural efficiency for dot product:  $s = s + \mathbf{a} * \mathbf{b}$  ( $\mathbf{a}, \mathbf{b}$  are vectors)

Dot Product	Expected Theoretical Peak Performance	Architectural Efficiency
Data from L1-cache	$10.12 / 1 = 10.12 \text{ Gflops}$	1.0
Data from L2-cache	$10.12 / 1 = 10.12 \text{ Gflops}$	1.0
Data from L3-cache	$10.12 / 1 \dots 4 = 2.53 - 10.12 \text{ Gflops}$	0.25 – 1.0
Data from memory	$10.12 * (0.31 \dots 1.26)/2 = 1.62 - 6.37 \text{ Gflops}$	0.16 – 0.63

# Nehalem's measured architectural Efficiency

Measured architectural efficiency for full triad:  $\mathbf{c} = \mathbf{c} + \mathbf{a}^*\mathbf{b}$  ( $\mathbf{a}$ ,  $\mathbf{b}$ ,  $\mathbf{c}$  are vectors)

Full Triad	Measured Performance	Architectural Efficiency
Data from L1-cache	1.45 Gflops	0.14
Data from L2-cache	1.3 Gflops	0.13
Data from L3-cache	0.2 – 0.95 Gflops	0.02 – 0.09
Data from memory	0.2 - 0.5 Gflops	0.02 – 0.05

Measured architectural efficiency for dot product:  $s = s + \mathbf{a}^*\mathbf{b}$  ( $\mathbf{a}$ ,  $\mathbf{b}$  are vectors)  
Measurement of library-routine (BLAS) in square brackets

Dot Product	Measured Performance	Architectural Efficiency
Data from L1-cache	2.2 [3.4] Gflops	0.22 [0.34]
Data from L2-cache	1.95 [2.9] Gflops	0.19 [0.29]
Data from L3-cache	0.5 - 1.6 [1.0 - 2.2] Gflops	0.05 – 0.16 [0.1 – 0.22]
Data from memory	0.5 - 1.15 [0.5 - 1.3] Gflops	0.05 – 0.11 [0.05 – 0.13]

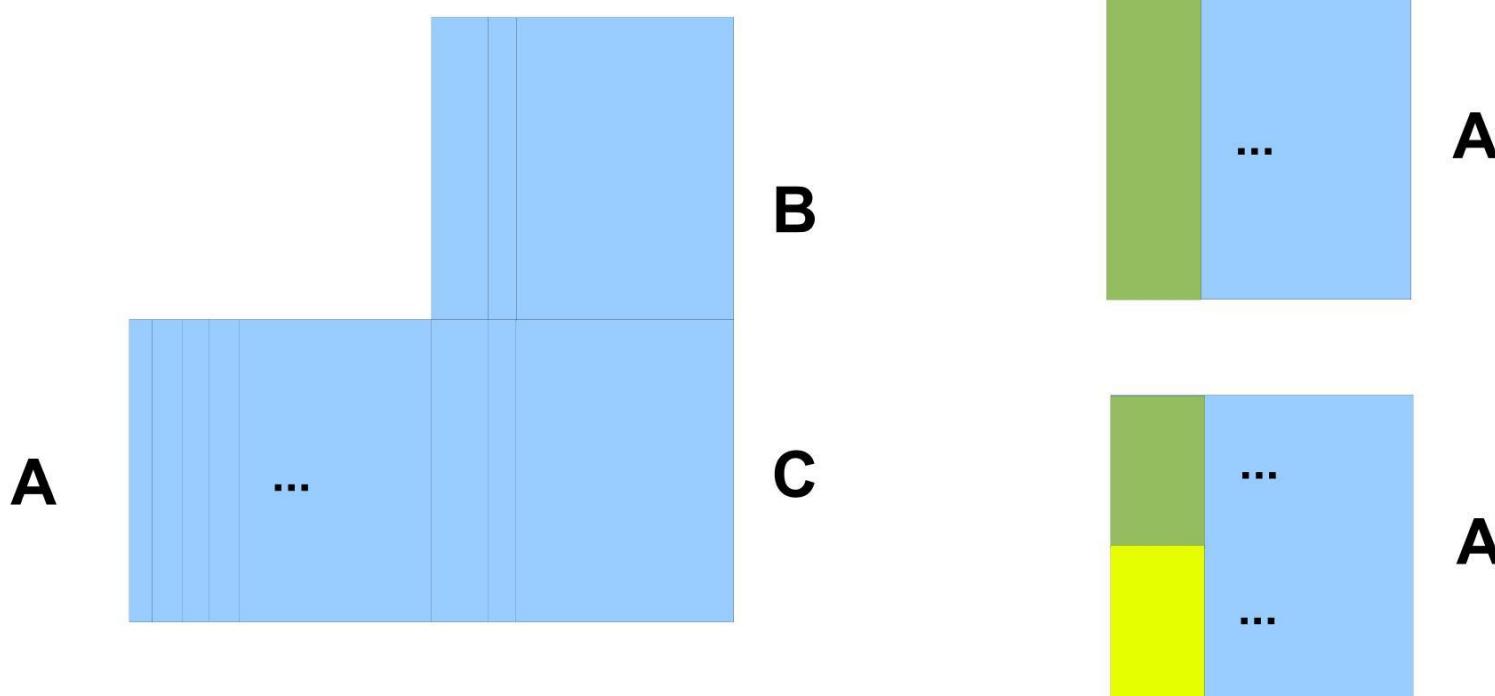

# Conclusions

- Implementation of cache reuse is necessary for a good performance
- Cache reuse optimized for L2-cache (instead for L3-cache) should lead to a better performance
- Usage of library-routines – as far as possible – further increases the performance of serial applications

# Cache Reuse (optimal)

- Matrix-Multiplication  $C = A * B$

$$c(i,j) = c(i,j) + a(i,k) * b(k,j)$$

# Cache Reuse (partly)

- Matrix-Vector-Multiplication  $c = A^*r$

$$r \quad \underline{\hspace{2cm}}$$
  
$$A \quad \begin{matrix} \diagdown \\ \diagdown \\ \diagdown \\ \diagdown \end{matrix} \quad = \quad \underline{\hspace{2cm}} \quad c$$

Solution for very large matrices:  
Striping in blocks of rows (columns)

$$r \quad \underline{\hspace{2cm}}$$
  
$$A \quad \begin{matrix} \diagdown \\ \diagdown \\ \diagdown \\ \diagdown \end{matrix} \quad = \quad \underline{\hspace{2cm}}$$

# Memory Requests with different Strides

- Definition of Stride: Stride is the distance in memory (addressing scheme) between successive array elements

Performance losses in percent for vectoroperation ( $c=a + b$ ) in comparison to stride 1

Stride	2	3	4	5	6	7	8	9	16	17	18	19	20	21	24	25	32	48	49	64	65	1 2 8	2 5 6	5 1 2	2 0 4 8
Perf. loss vl=100	0	0	0	0	0	0	0	0	0	0	0	0	10	0	40	12	0	0	0	56	0	72	74	78	96
Perf. loss vl=10.000	28	32	53	54	68	72	75	75	75	75	75	75	75	75	75	75	75	72	73	75	75	89	93	97	97

# Memory Request with different Strides (2)

- Avoid strides  $\neq 1$  because of reduction of available cache size and heavy performance reduction if data come from memory
- Example for large stride:  
Matrix-Multiplication in dot product form (e.g. 1024x1024 matrices)  
 $c(i,j) = c(i,j) + a(i,\underline{k}) * b(\underline{k},j)$

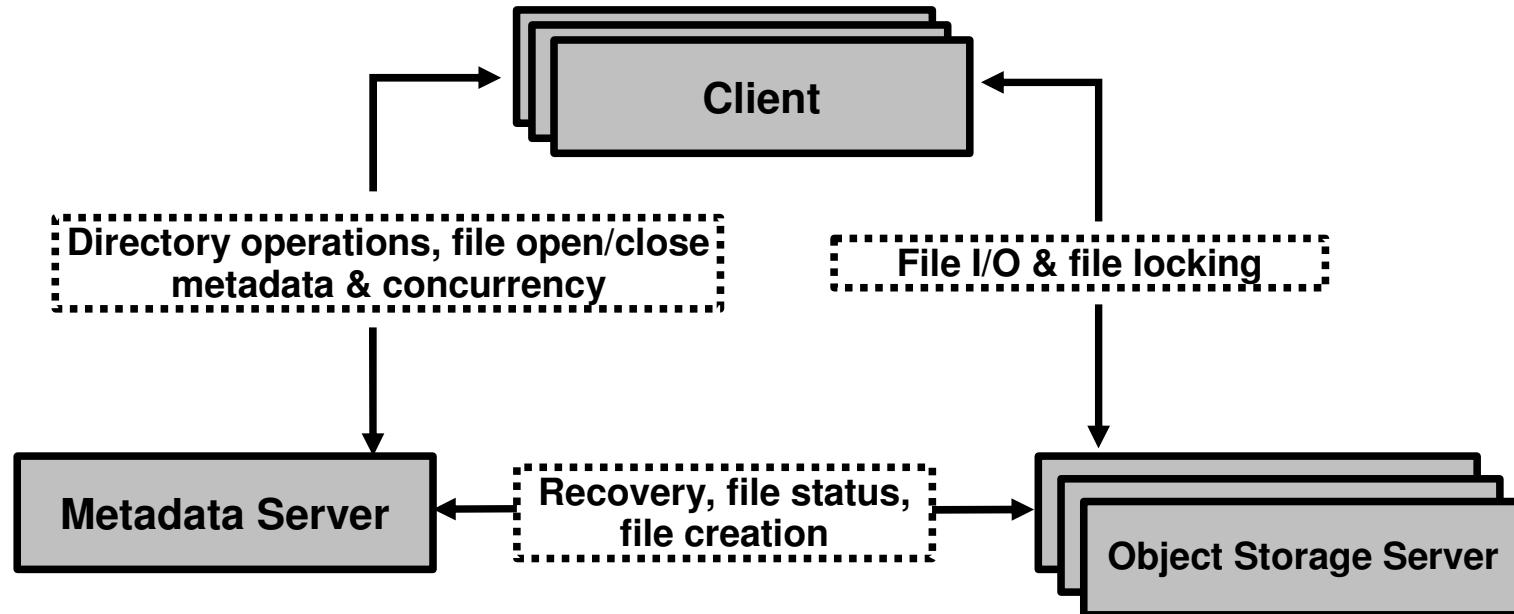

# Using file systems at HC3

Roland Laifer

STEINBUCH CENTRE FOR COMPUTING - SCC

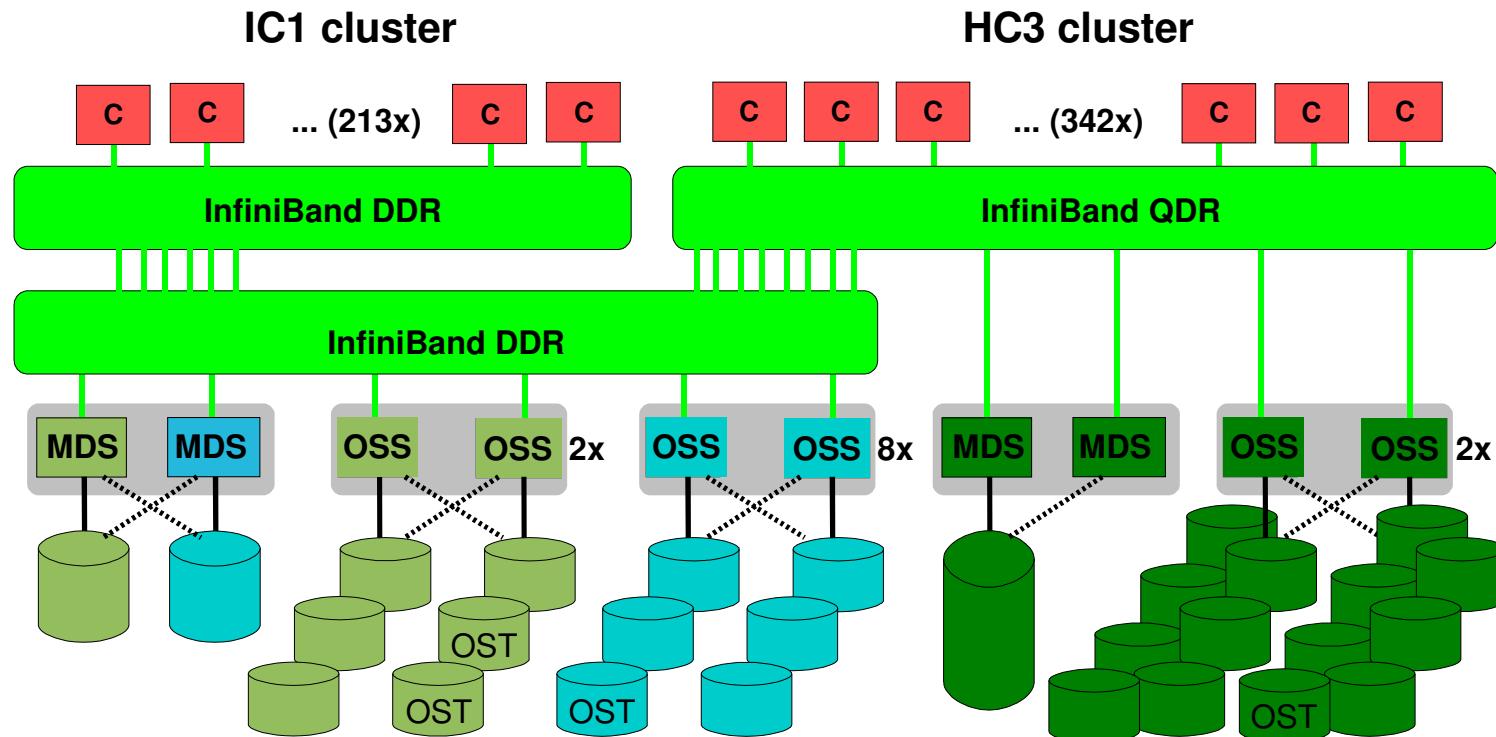

# Basic Lustre concepts

- Lustre components:
  - Clients (C) offer standard file system API
  - Metadata servers (MDS) hold metadata, e.g. directory data
  - Object Storage Servers (OSS) hold file contents and store them on Object Storage Targets (OSTs)
  - All communicate efficiently over interconnects, e.g. with RDMA

# Lustre file systems at HC3

File system	\$HOME	\$PFSWORK	\$WORK
Capacity (TiB)	76	301	203
Storage hardware	transtec provigo	transtec provigo	DDN S2A9900
# of OSTs	12	48	28
# of OST disks	192	768	290

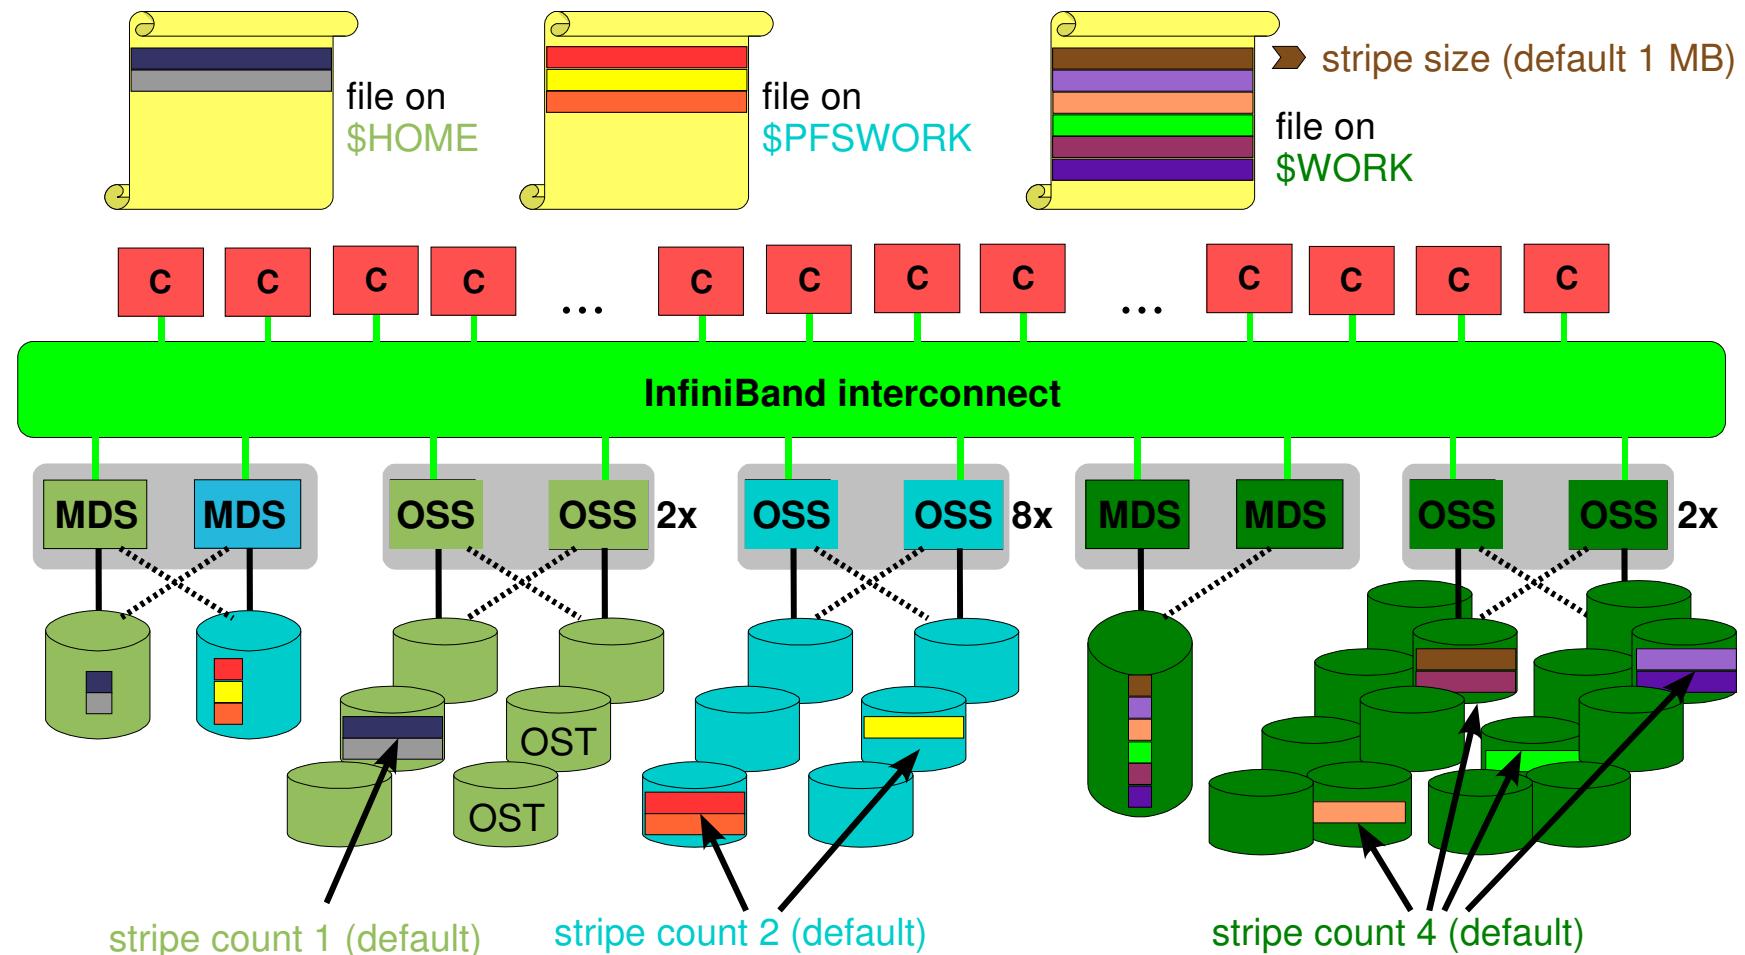

# File system properties

Property	\$TMP	\$HOME	\$WORK	\$PFSWORK
<b>Visibility</b>	local node	HC3, IC1	HC3	HC3, IC1
<b>Lifetime</b>	batch job	permanent	> 7 days	> 7 days
<b>Capacity</b>	thin/med.   fat   login 129   673   825 GB	76 TB	203 TB	301 TB
<b>Quotas</b>	no	not enforced	not enforced	not enforced
<b>Backup</b>	no	yes	no	no
<b>Read perf. / node</b>	thin/medium   fat 70   250 MB/s	for IC1 nodes 600 MB/s	1800 MB/s	for IC1 nodes 600 MB/s
<b>Write perf. / node</b>	thin/medium   fat 80   390 MB/s	for IC1 nodes 700 MB/s	1800 MB/s	for IC1 nodes 800 MB/s
<b>Total read perf.</b>	$n^*70$   $n^*250$ MB/s	1700 MB/s	4800 MB/s	6200 MB/s
<b>Total write perf.</b>	$n^*80$   $n^*390$ MB/s	1500 MB/s	4800 MB/s	5500 MB/s

# Which file system to use?

- Follow these recommendations:
  - Whenever possible use \$TMP for scratch data
  - Use \$WORK for scratch data and job restart files
  - Use \$PFSWORK to share scratch data between clusters
  - Use \$HOME for long living data and when backup is required
  - Archive huge and unused data sets

# How does striping work?

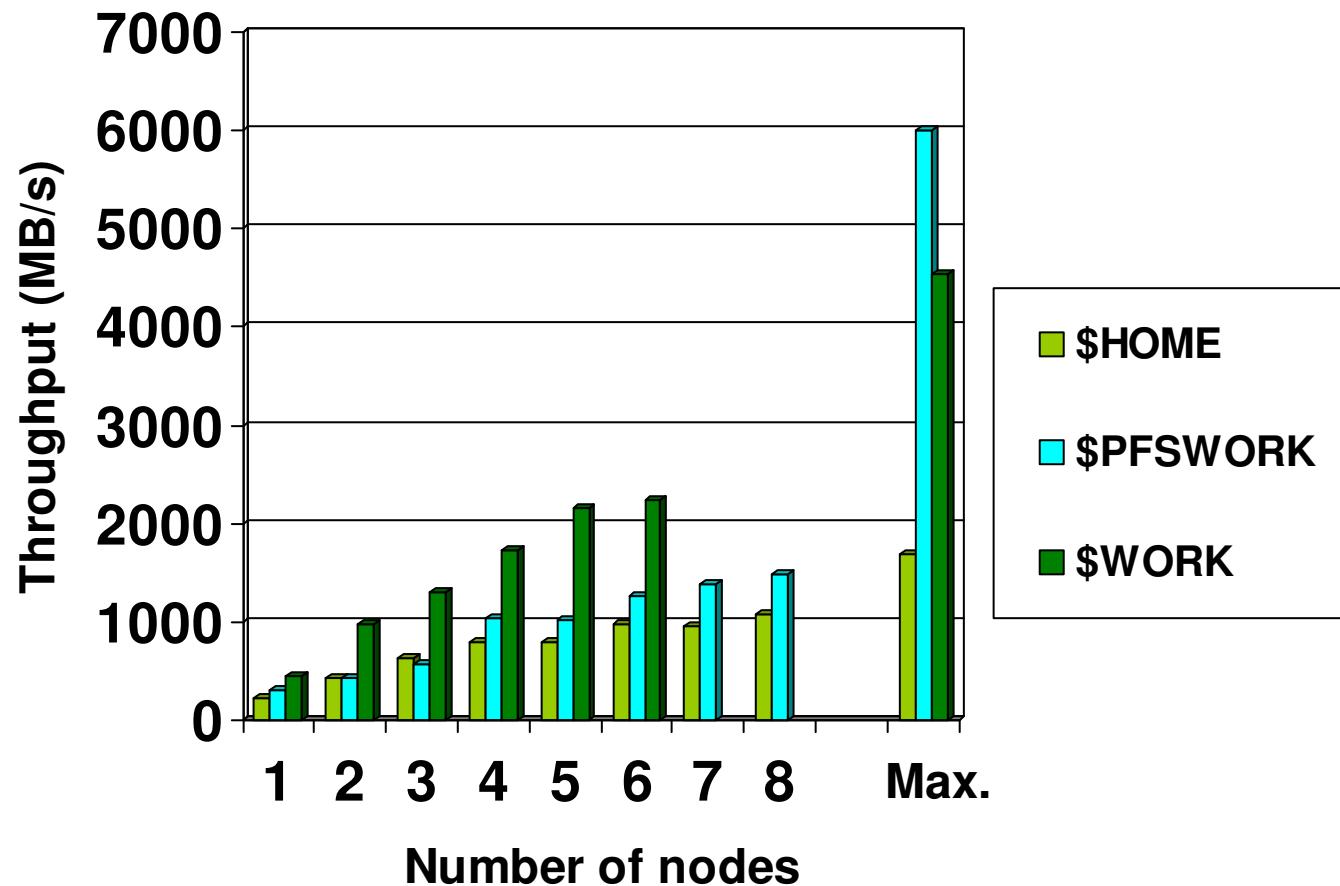

- Parallel data paths from clients to storage

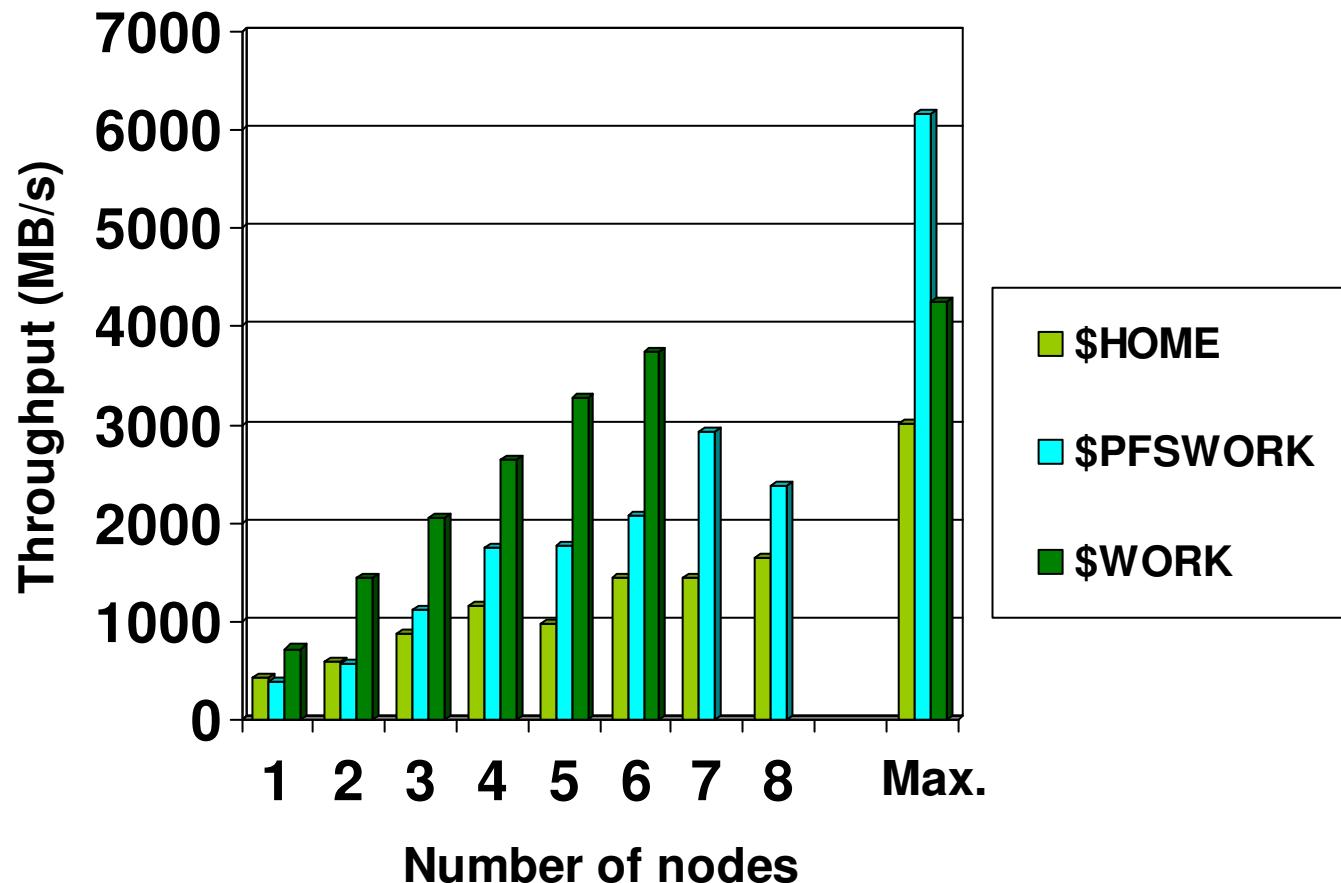

# Using striping parameters

- Important hints to use striping
  - Striping parameters inherited from parent directory or file system default
    - To change parameters for existing file, copy it and move it back to the old name
  - Each new file is automatically created on new set of OSTs
    - No need to adapt striping parameters if many files are used in similar way!
- Adapt striping parameters to increase performance
  - OST performance is usually limited by storage subsystem
    - At HC3 pretty similar for all 3 file systems: ~200 MB/s
    - Increasing the stripe count might improve performance with few large files
  - Adapt stripe size to match application I/O pattern
    - Only makes sense in rare cases
- Show and adapt striping parameters
  - Show parameters: *lfs getstripe <file/directory>*
  - Change the stripe count: *lfs setstripe –c <count> <file/directory>*
  - Change the stripe size: *lfs setstripe –s <size> <file/directory>*

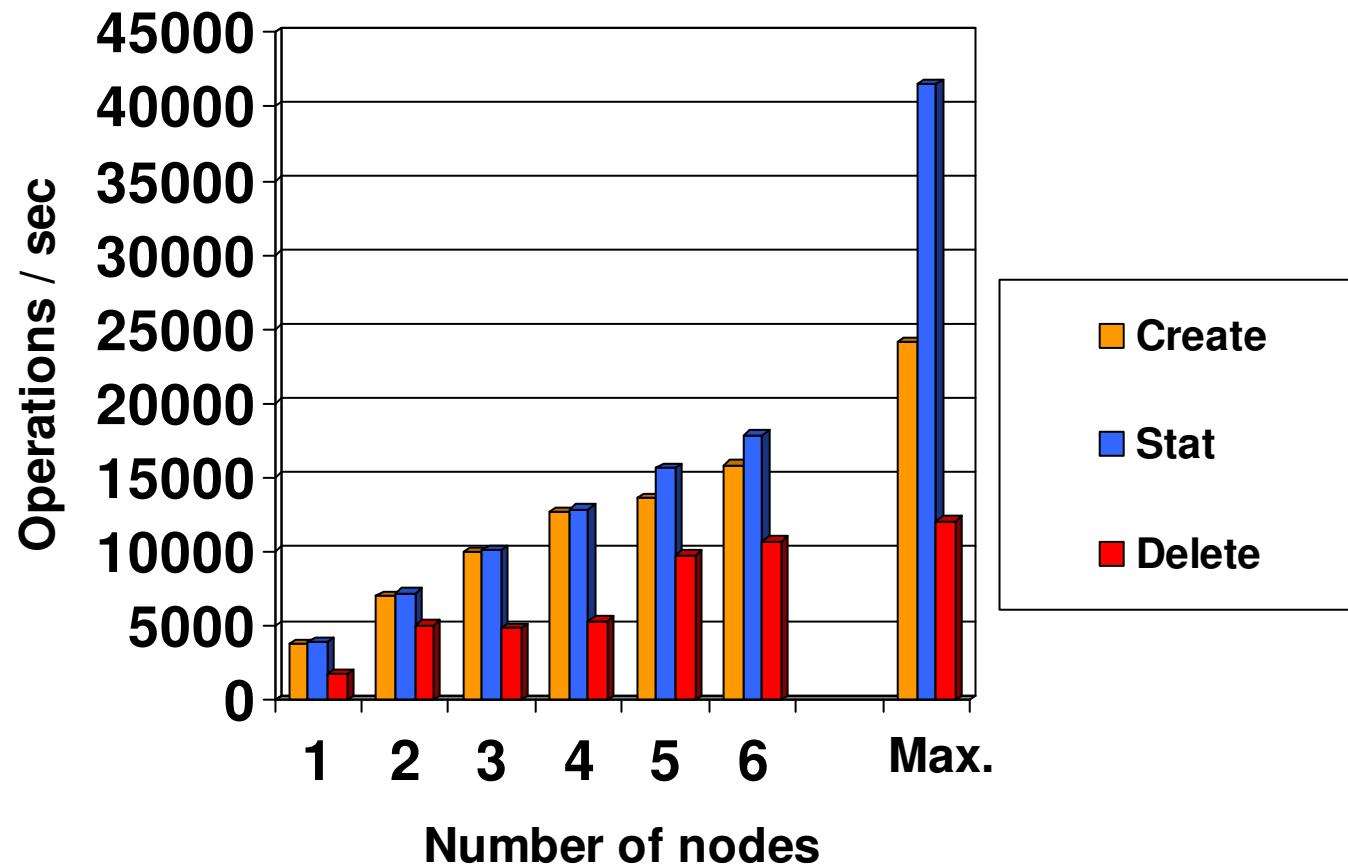

# Write performance with default stripe count

# Read performance with default stripe count

# Metadata performance

## Best practises (1)

- Change nothing if you use few (< 100) small (< 10MB) files
- Increasing throughput performance:
  - Use moderate stripe count (4 or 8) if only one task is doing IO
    - Improves single file bandwidth per client
  - To exploit complete file system bandwidth use several clients
    - Different files from different clients are automatically distributed
    - For one shared file use chunks with boundaries at stripe size
    - If many tasks use few huge files set stripe count to -1
  - Use stripe count 1 if lots of files are used in the same way
  - Collect large chunks of data and write them sequentially at once
  - Avoid competitive file access
    - e.g. writing to the same chunks or appending from different clients
    - e.g. competitive read/write access
  - Use \$TMP whenever possible
    - If data is used by one client and is small enough for local hard drives

## Best practises (2)

- Increasing metadata performance:
  - Avoid creating many small files
    - For parallel file systems metadata performance is limited
  - Avoid searching in huge directory trees
  - Avoid competitive directory access
    - e.g. by creating files for each task in separate subdirectories
  - If lots of files are created use stripe count 1
  - Use \$TMP whenever possible
    - If data is used by one client and is small enough for local hard drives
    - This also allows to reduce compilation times
  - Change the default colorization setting of the ls command
    - alias ls='ls -color=tty'
    - Otherwise ls command needs to contact OSS in addition to MDS

# Understanding application I/O behaviour

- Application properties with impact on I/O:
  - Number and size of files
  - Access pattern, i.e. random or sequential
  - Buffer size of file operations
  - Type and number of operations (read, write, create, delete, stat)
  - Number of clients executing the operations
- External factors with impact on application I/O:
  - Overall usage of file system components
    - Storage, OSS, MDS, networks, clients
    - Administrators can tell the current status
- For help to analyse and improve I/O performance

# SimLabs@KIT

**Frank Schmitz**

STEINBUCH CENTRE FOR COMPUTING - SCC

# Steinbuch Centre for Computing (SCC)

SCC at  
Karlsruhe University

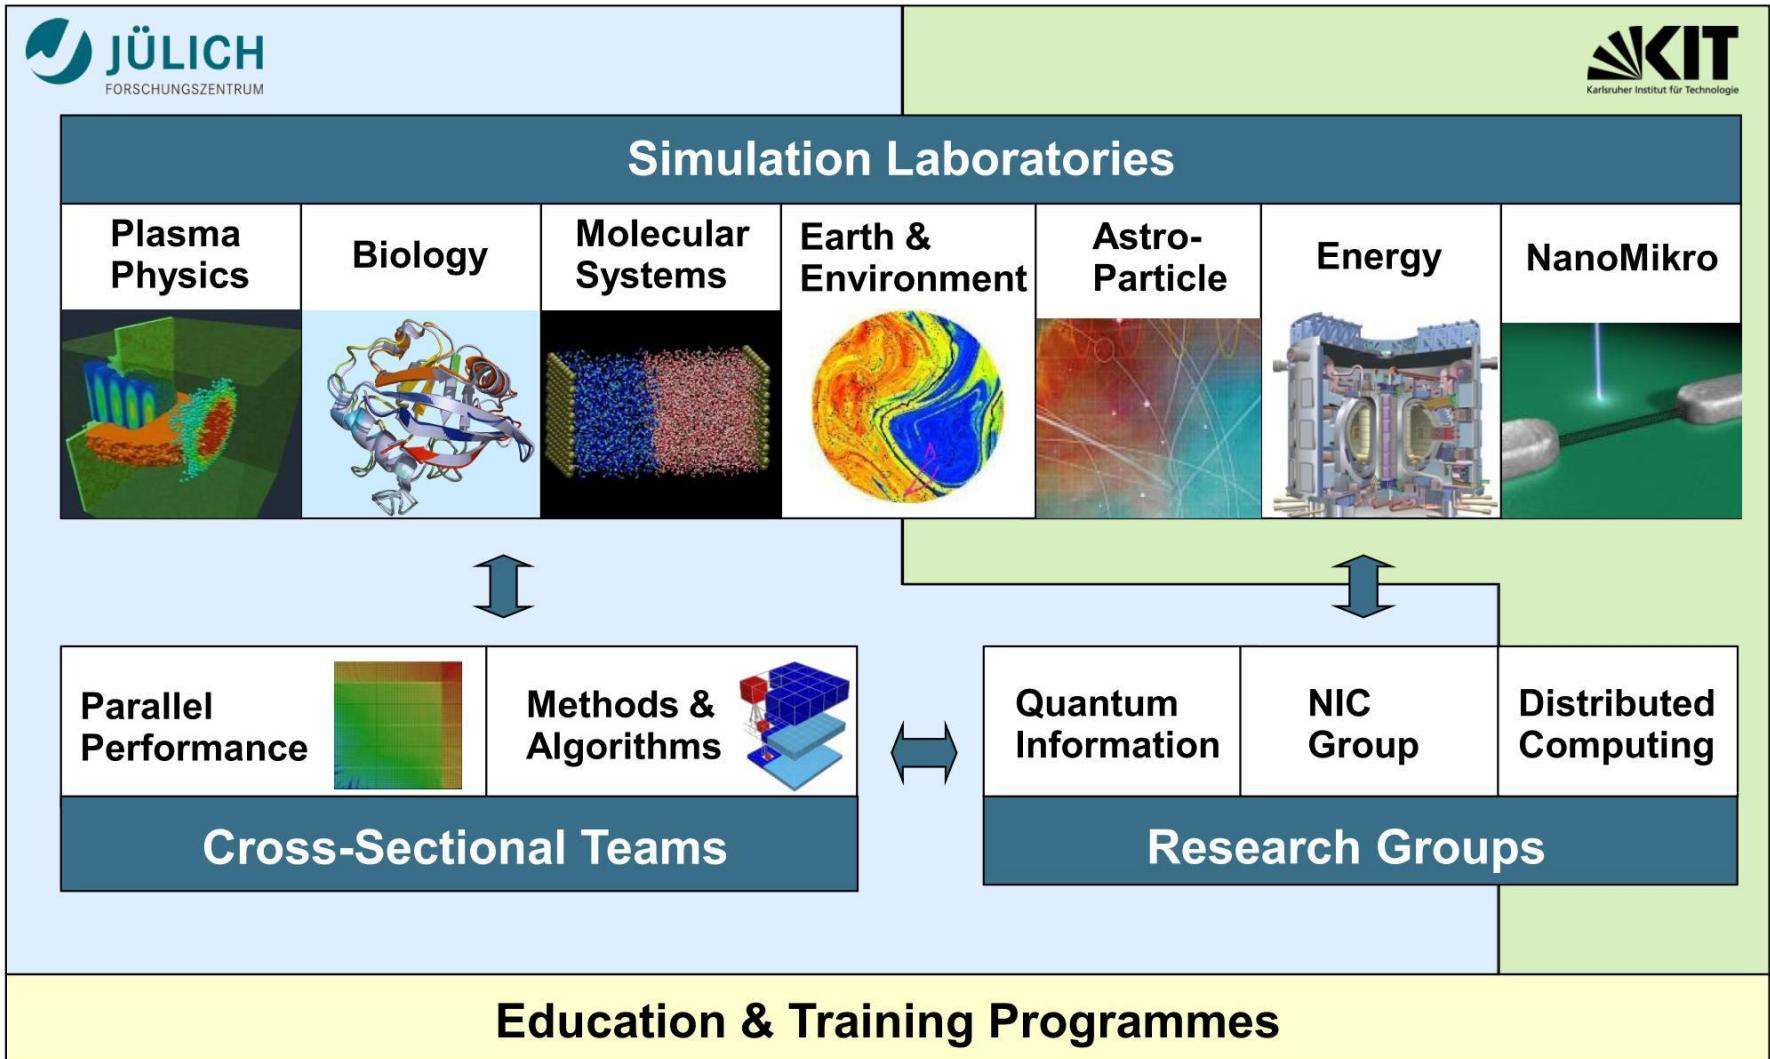

SCC at Research Center

- Founded on January 1<sup>st</sup>, 2008
- Information Technology Center of KIT
- Merger of the Computing Center of Karlsruhe University and Research Center Karlsruhe
- One of the largest scientific computing centers in Europe

# Simulation Laboratory (SimLab)

- One major idea with Forschungszentrum Jülich
- Discussion started autumn 2008
- Program-oriented funding in the Research Field Key Technologies by the Helmholtz Association
- Review in spring 2009
- Funding starts 1.1.2010

# SimLabs as part of the Program „Supercomputing“

# Simulation Laboratory (SimLab)

- Mission of the SimLabs is R&D&I and the support of applications coming from different scientific areas at KIT. The activities of the four SimLabs are very close to the KIT Centers.
- SimLabs are the glue between high performance (HPC) and data intensive computing (DIC), science and scientific computing.
- SimLabs support HPC&DIC applications and are part of the SCC service concept, and support scientists by using HPC resources outside KIT.

# Simulation Laboratory (SimLab)

- activities in education (Ph.D. students, students, interns)
- integration of projects (Young Investigator Group → confirmed, HPC-5 since 2010, MMM@HPC since 2010→ FP7, other internal KIT-projects)
- SimLabs at KIT are involved in external projects with and without KIT institutes. But the main activities are within KIT.

# Software Packages on HC3

**Paul Weber**

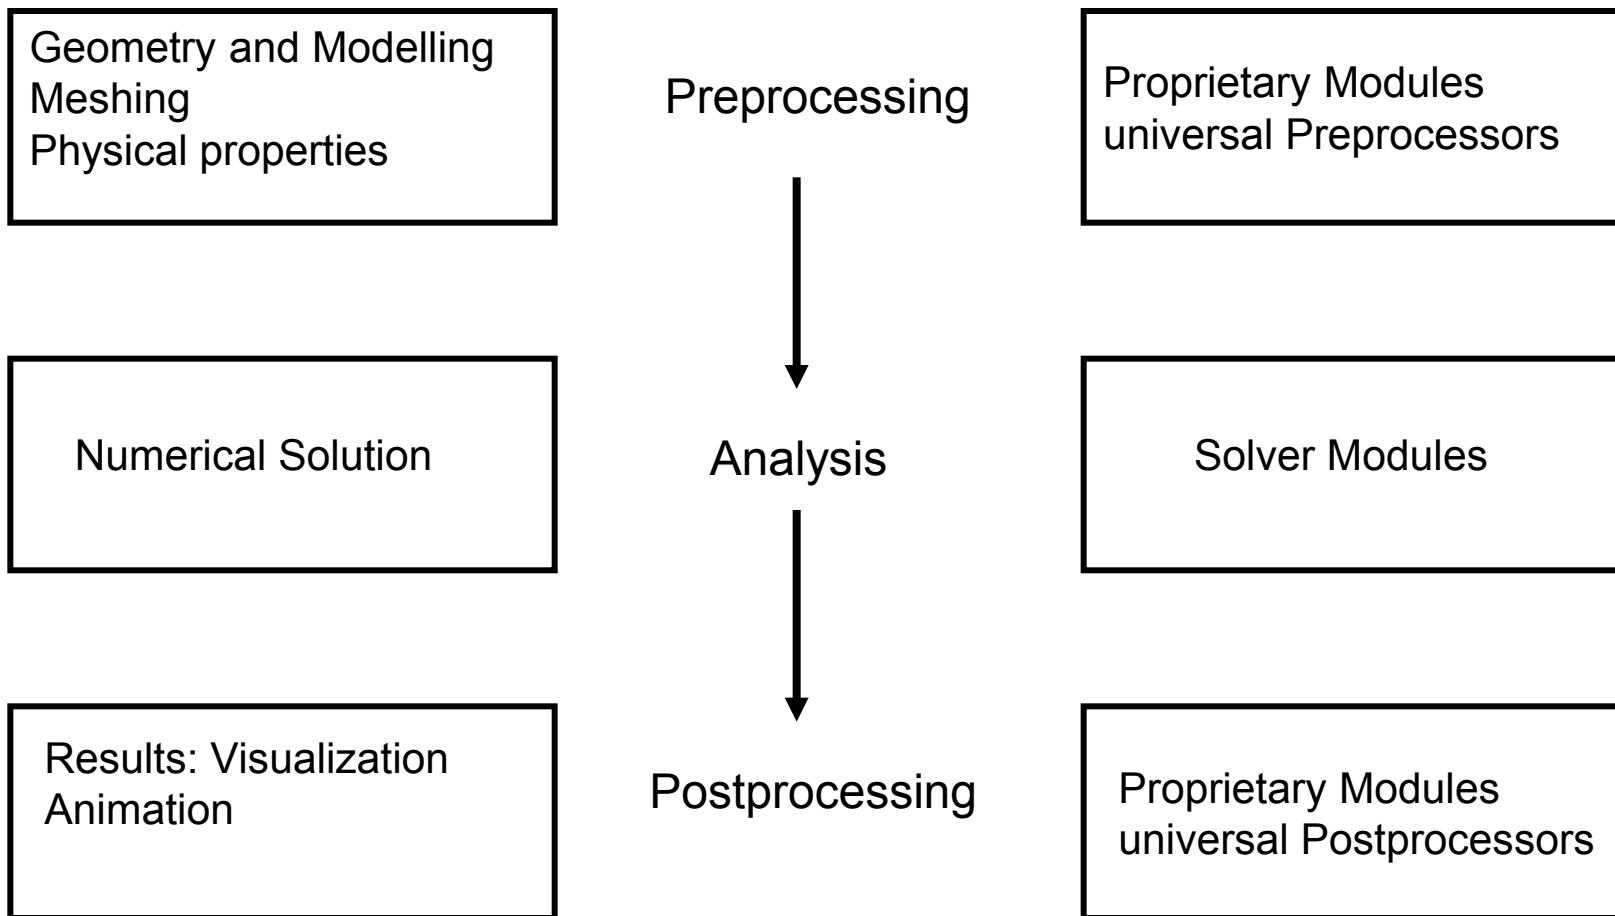

STEINBUCH CENTRE FOR COMPUTING - SCC

# Overview

- All important distributors of CAE programs provide their applications on cluster computers
- Large performance improvements by parallelization, potentially only SMP
- CAE program packages cover problem solutions in the area of
  - Structural mechanics and heat transfer
  - Computational fluid dynamics (CFD)
  - Electrodynamics and propagation of electromagnetic fields
  - Couplings of these phenomena (multiphysics)
- Mathematical methods: Finite Element Method, Finite Volume Method, Lattice Boltzmann

# Course of a project

# Some important CAE packages on the HC3

- ABAQUS, ANSYS      structural mechanics, heat transfer, CFD  
implicit/explicit, linear/nonlinear  
Multiphysics, SMP and DMP
- ADINA      structural mechanics, heat transfer, CFD  
implicit/explicit, linear/nonlinear, SMP and DMP  
Multiphysics
- MD Nastran      structural mechanics, heat transfer  
implicit, linear, SMP and DMP  
coupling to nonlinear and explicit codes of  
Dytran and MSC.Marc
- MSC.Marc      structural mechanics, heat transfer, CFD,  
electro-/magnetostatics  
implicit, nonlinear, SMP and DMP
- LS-DYNA      structural mechanics, explicit dynamics,  
SMP and DMP

# Some important CAE packages on the HC3

- ANSYS Fluent  
ANSYS CFX
  - CFD, fluids, particles, combustion, chemical reactions, multi phase, turbo machinery, SMP and DMP
- STAR-CD  
STAR-CCM+
  - CFD, fluids, particles, combustion, chemical reactions, phase transitions, SMP and DMP
- PowerFLOW
  - CFD, Lattice Boltzmann, external /internal flows, DMP
- COMSOL Multiphysics
  - general PDEs, specialized modules for structural, CFD, electromagnetics, chemical engineering, heat transfer, MEMS, earth science, fuel cells, Multiphysics, coupling with MATLAB, SMP and DMP
- MATLAB
  - macro language for numerical calculations, many special toolboxes in many areas of engineering, finance, statistics, image processing et al.
  - DMP (and SMP)

# Miscellaneous programs

- Preprocessing tools for modelling and meshing
  - ANSYS Workbench, HyperMESH, ANSYS ICEM\_CFD, Patran, Gambit/TGRID
- Postprocessing tools for results visualization and animation
  - ANSYS Workbench, HyperVIEW, Patran, EnSight

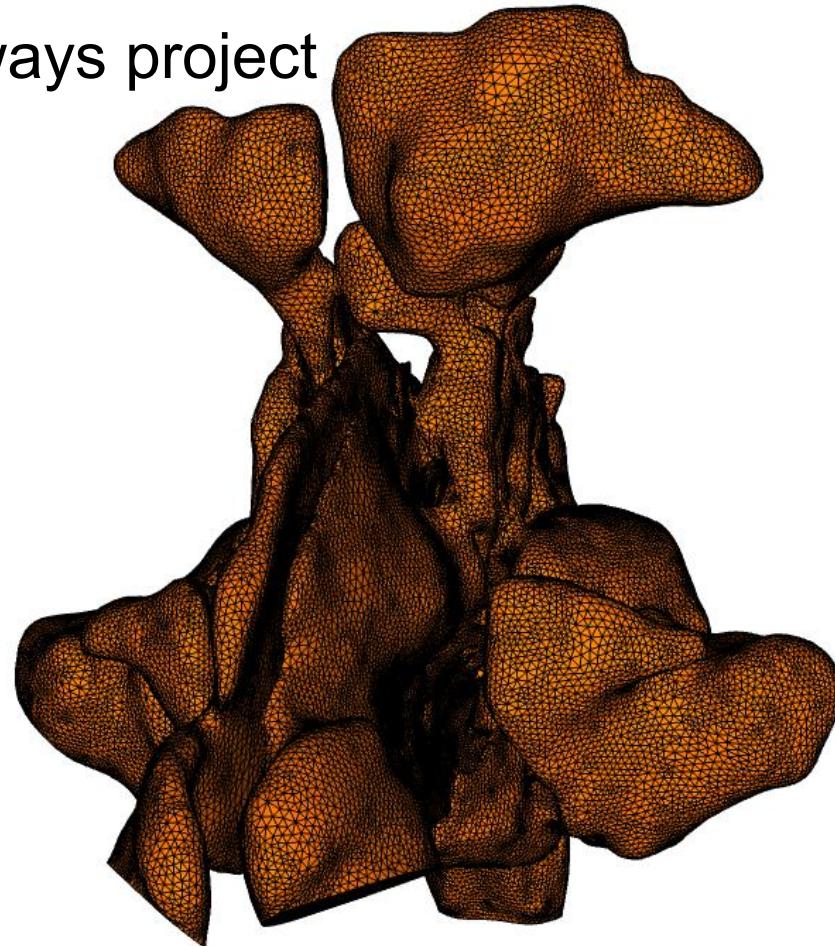

# Running CAE programs in the HC3 environment

- Nonstandard batch environment (JMS)
- Starting a batch job with the `job_submit` command
  - allocation of memory, cores, cpu time
  - administration of the batch queue
  - initialization of the job
- Launching of the CAE programmes by individual commands
  - Combination of `job_submit` and the original program calls
  - request of system resources and setting the job parameters by a single command
- FLUENT Example

```
fluentjob -j NAME -v VERSION -t CPU-TIME -m MEMORY  
          [-c CLASS] [-d NODE] [-T TIME] [-p PROCS]
```

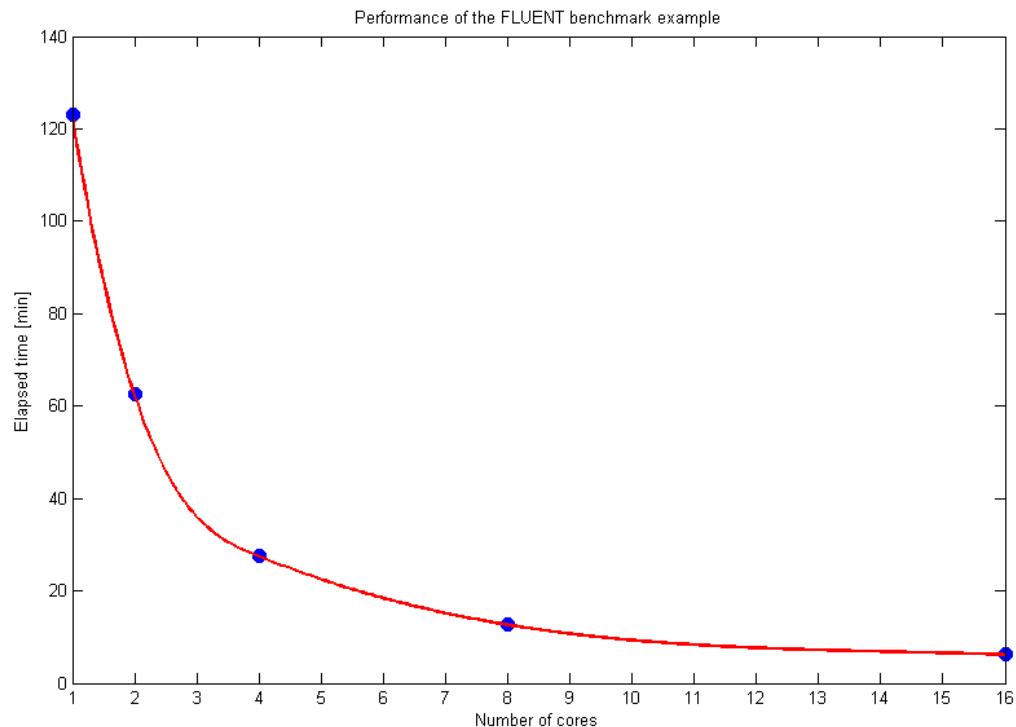

# Fluent Example Benchmark

- Model of a respiratory system
- Study for the United Airways project
- about 2 million cells
- only laminar flow,  
no turbulence modelling

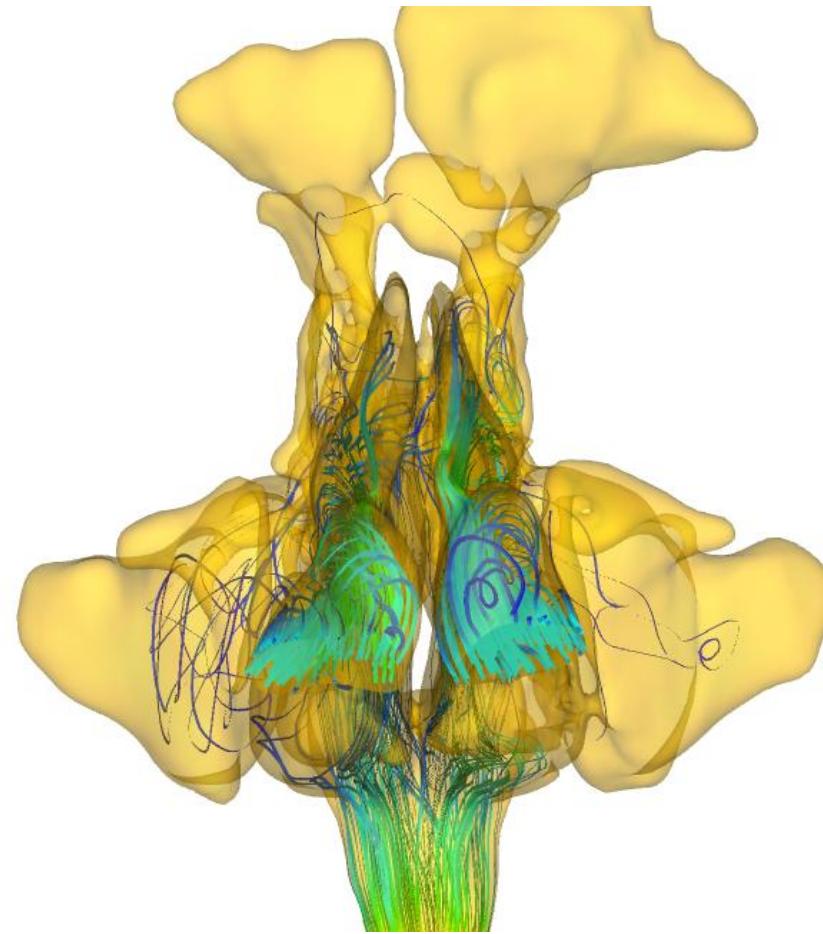

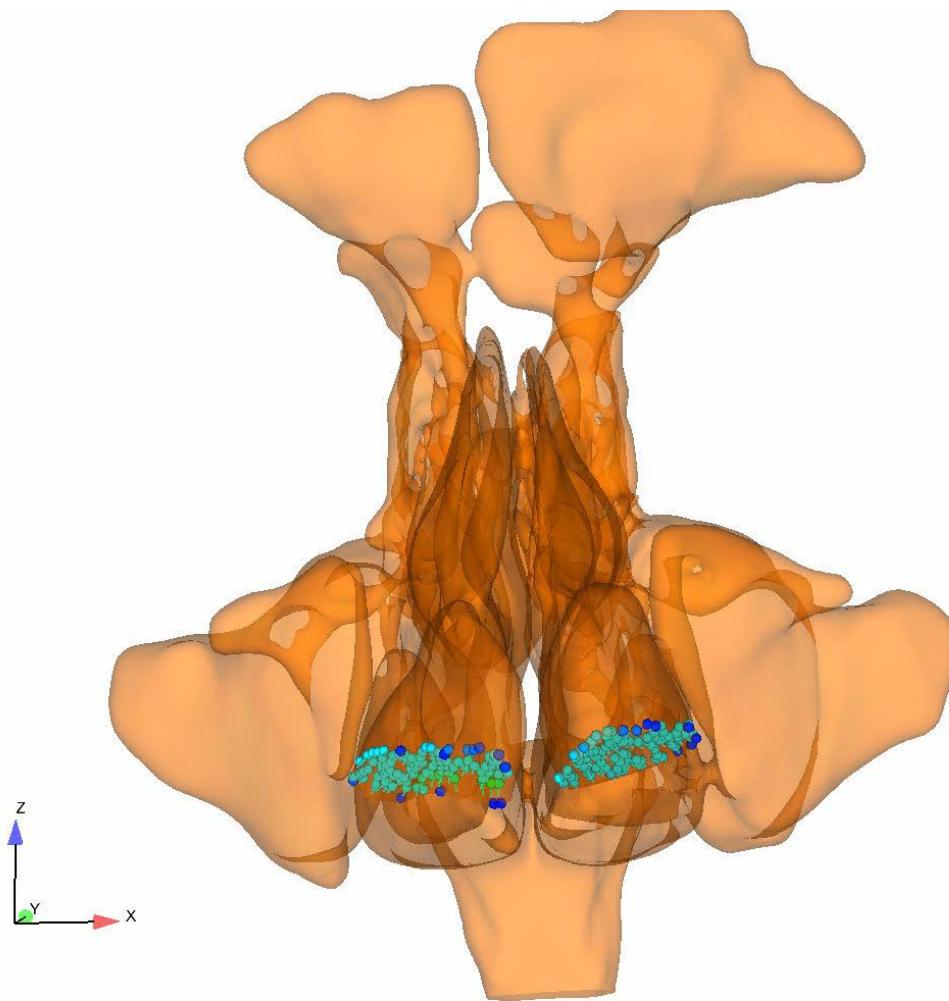

# Scaling behavior

- Memory: 16 GByte/processor
- Distribution on up to 16 processors
- each process runs exclusively on one node
- Running processes on up to 8 cores on one node (SMP) shows almost identical performance

# Results: velocity

# Thank you for your attention
