### Outline

- Introduction
- Theoretical view on NI resolution
- Application on the systems Zr – H and ZrO<sub>2</sub> - ZrN
- Conclusions

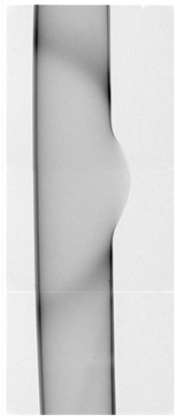

M. Grosse:  
Which Resolution can be achieved in praxis  
In neutron imaging experiments 8<sup>th</sup> International Topical Meeting on Neutron Radiography, ITMNR-8  
4-8 September 2016, Beijing, China Institute for Applied Materials  
Program NUSAFE

## Introduction

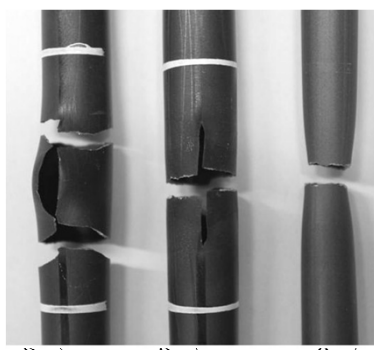

### Hydrogen in Zircaloy

Hydrogen enrichments in nuclear fuel cladding tubes made of Zircaloy after loss of coolant accident simulation

Rupture near to the burst opening due to hydrogen enrichment

Rupture across the burst opening due to stress concentration

Rupture near the end plugs after necking

M. Grosse:  
Which Resolution can be achieved in praxis  
In neutron imaging experiments

8<sup>th</sup> International Topical Meeting on Neutron Radiography, ITMNR-8  
4-8 September 2016, Beijing, China

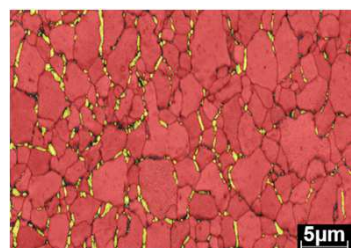

Institute for Applied Materials  
Program NUSAFE

## Introduction

### Hydrogen in Zircaloy

#### Delayed Hydride Cracking

5µm

$\Sigma(\text{Zry-4}) = 0.21 \text{ cm}^{-1}$   
 $\Sigma(\text{ZrH}_2) = 5.80 \text{ cm}^{-1}$   
 → high n contrast

M. Grosse:  
Which Resolution can be achieved in praxis  
In neutron imaging experiments

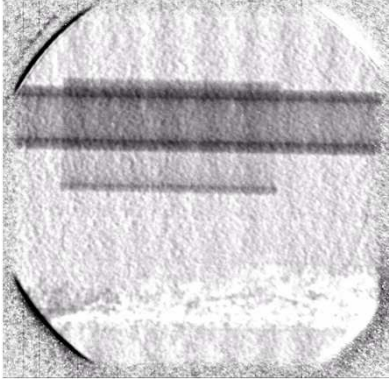

8<sup>th</sup> International Topical Meeting on Neutron Radiography, ITMNR-8  
4-8 September 2016, Beijing, China

Program NUSAFE

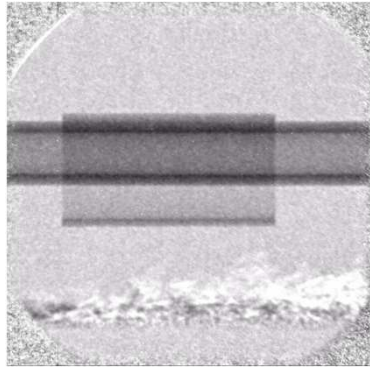

## Introduction

### ZrN in ZrO<sub>2</sub>

**Zry-4, 900°C, 12 l/h Ar, 2 g/h H<sub>2</sub>O**

**Zry-4, 900°C, 12 l/h Ar, 2 l/h H<sub>2</sub>O  
+ 10 l/h N<sub>2</sub>**

M. Grosse:  
Which Resolution can be achieved in praxis  
In neutron imaging experiments

8<sup>th</sup> International Topical Meeting on Neutron Radiography, ITMNR-8  
4-8 September 2016, Beijing, China

Institute for Applied Materials  
Program NUSAFE

## Introduction

### ZrN in ZrO<sub>2</sub>

$\Sigma(\text{ZrO}_2) = 0.44 \text{ cm}^{-1}$   
 $\Sigma(\text{ZrN}) = 0.81 \text{ cm}^{-1}$   
 → low n contrast

M. Grosse:  
Which Resolution can be achieved in praxis  
In neutron imaging experiments

8<sup>th</sup> International Topical Meeting on Neutron Radiography, ITMNR-8  
4-8 September 2016, Beijing, China

Institute for Applied Materials  
Program NUSAFE

## Introduction

Can we investigate single  $ZrH_2$  precipitates in Zry-4 or ZrN precipitates in  $ZrO_2$  by means of neutron imaging (formation, re-distribution, re-orientation)?

Spatial resolution in the order of  $1\mu m$  is needed!

M. Grosse: Which Resolution can be achieved in praxis In neutron imaging experiments

8<sup>th</sup> International Topical Meeting on Neutron Radiography, ITMNR-8  
4-8 September 2016, Beijing, China

Institute for Applied Materials  
Program NUSAFE

## Theoretical view

The object has to give a contrast to the matrix

$$\frac{|I_o - I_M|}{I_M} = \frac{1 - \exp(-(\Sigma_o - \Sigma_M) s_o)}{\sqrt{I_M + I_B}} > \frac{I_M - I_B}{I_M - I_B}$$

The pixel size has to be smaller than the object size

$$s_{pixel} < s_o$$

$$I \sim s_{pixel}^2$$

The collimation has to be good enough

$$\frac{L}{d} \geq \frac{1}{s_o}$$

$$I \sim \left(\frac{L}{d}\right)^{-2}$$

$$N_{projections} = \frac{\pi s_M}{2 s_o}$$

$$\Delta t = \frac{4 l^2}{\phi_1 (\Delta \lambda, \lambda) s_o^4 (1 - \exp(-\Delta \Sigma s_o))^2}$$

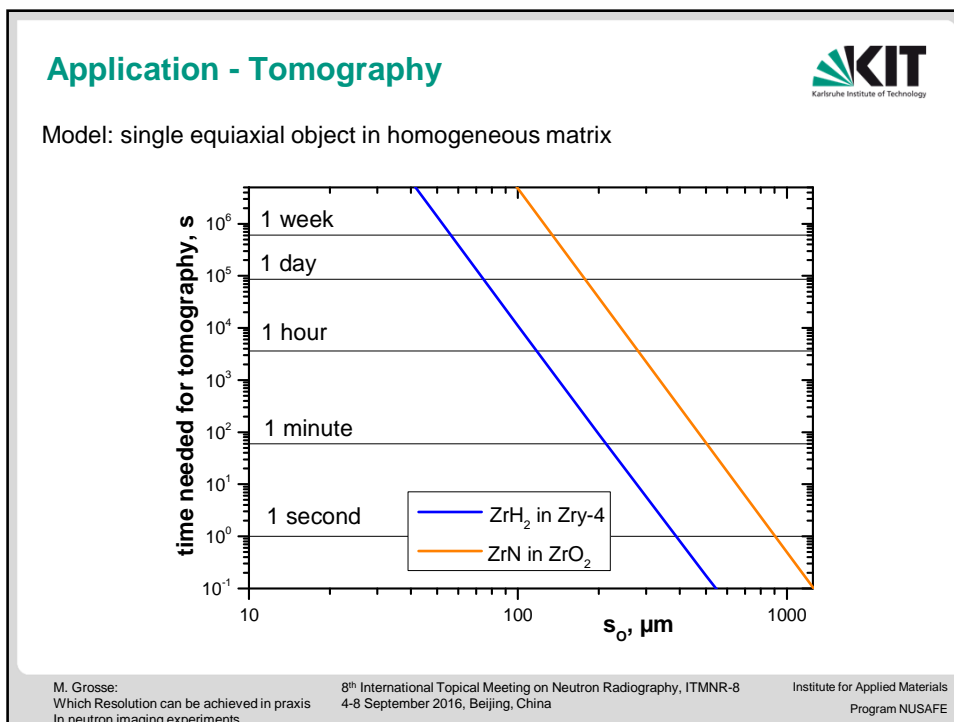

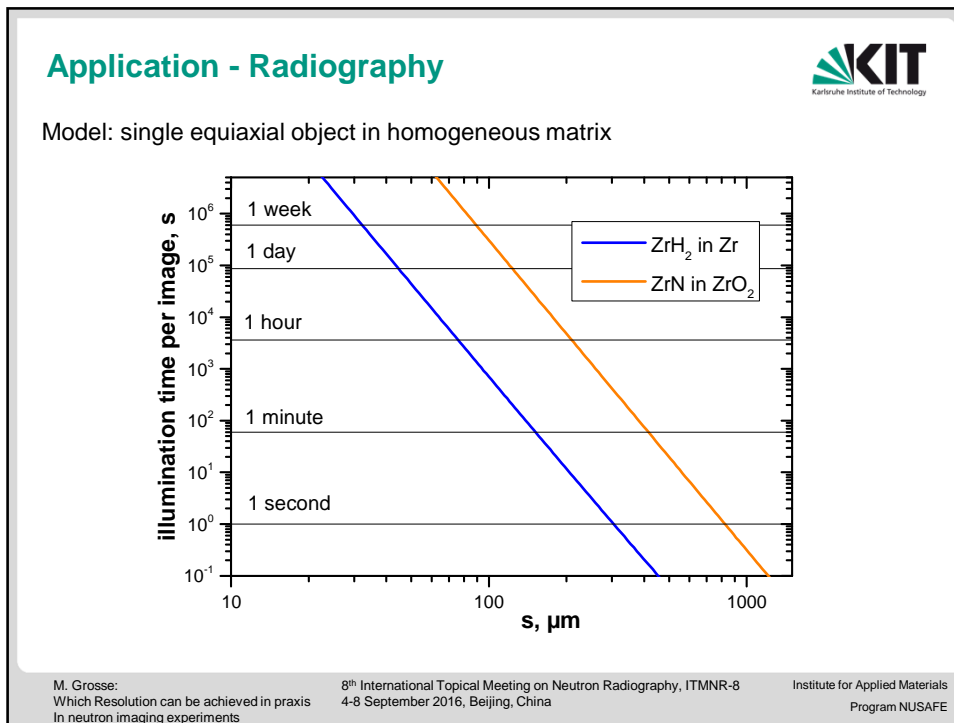

→

$$t = \frac{2 \pi s_M l^2}{\phi_1 s_o^5 (1 - \exp(-(\Sigma_o - \Sigma_M) s_o))^2}$$

M. Grosse: Which Resolution can be achieved in praxis In neutron imaging experiments

8<sup>th</sup> International Topical Meeting on Neutron Radiography, ITMNR-8  
4-8 September 2016, Beijing, China

Institute for Applied Materials  
Program NUSAFE

### Remarks

- LiF based transmitter foils do not improve the situation compared to Gadox foils even the counts per pixel are higher.
- The analysis is valid for pinhole geometry. If neutron optics are applied the collimation condition can be deleted.

## Remarks

- LiF based transmitter foils do not improve the situation compared to Gadox foils even the counts per pixel are higher.
- The analysis is valid for pinhole geometry. If neutron optics are applied the collimation condition can be deleted
- The analysis is valid for equiaxial objects. Often rod- or disc-shaped objects or interfaces are of interest. In these cases the contrast depends on the neutron path length through the object.
- Often additional contrasts can be used (Fraunhofer diffraction, refraction, total reflexion, ...). It would improve the situation.
- Increasing one component of the resolutions needs decreasing at least one other resolution component (e.g. strain imaging with  $\Delta\lambda/\lambda < 10^{-3}$ )

## Conclusions (1)

- Resolution in NI is a multidimensional ellipsoid surface depending on the differences in the total macroscopic neutron cross sections and the power of the source. At this surface the different resolution components can be varied.
- For pinhole camera setups the different dimensions of resolution are connected as following:

- Time ~ spatial resolution  $t \sim s_o^{-4} (1 - \exp(-\Delta\Sigma s_o))^{-2}$  (radiography)

- Time ~ wavelength resolution  $t \sim s_o^{-5} (1 - \exp(-\Delta\Sigma s_o))^{-2}$  (tomography)

- Time ~ contrast between the total neutron cross sections  $t \sim \phi_1(\Delta\lambda, \lambda)^{-1}$

- Time ~ contrast between the total neutron cross sections

$$t \sim (1 - \exp(-\Delta\Sigma s_o))^{-2}$$

## Conclusions (2)

- Single objects of a size of 40  $\mu\text{m}$  and 100  $\mu\text{m}$  can be investigated by means of radiography in the systems  $\text{ZrH}_2$  in Zry-4 and  $\text{ZrN}$  in  $\text{ZrO}_2$ , respectively, in realistic times.
- For tomography the limits are 60 and 150  $\mu\text{m}$ , respectively.
- Whether single  $\text{ZrN}$  precipitates in  $\text{ZrO}_2$  nor  $\text{ZrH}_2$  precipitates in Zry can be investigated yet by means of neutron imaging methods.
- Much stronger neutron sources are needed for these investigations.
