

Assessment of air quality in urban conglomerations, mega cities and sensitive regions

A challenge for a sustainable development of urban agglomerations from a different point of view

Peter Suppan

Urban Settlements - Facts

- In 1900 about **3 %** of the worlds population lived in cities; **33 %** in the 50s - since 2007 more than **50 %**; and 3 out of 5 in 2030
- **15 %** of the urban population live in Mega-Cities (>10 Mill.)
- **37% to 49%** of global CO₂-emissions are released by cities (5th IPCC Assessment Report)
- Urban emissions have a severe impact on air quality and regional climate (Hodzic et al. 2010, Kanakidou et al. 2012, Parrish & Zhu 2009)
- **70 %** of the world wide energy is needed by urban infrastructures (5th IPCC Assessment Report)
- About **75 %** of the material flow is realized in cities
- Climate change have/will have a strong impact on urban agglomerations (e.g. heat island effect) and related processes
- Air pollution levels in urban areas depend not only on local emissions but also on regional emissions (e.g. BVOC, Papiez et al. 2009)

5 Escuela Internacional de Desarrollo Sostenible
Medellín / Colombia – Octubre 31, 2017

Driving Forces

- Quality of life (→ health-related; atmosphere, water, biosphere, soil)
- Climate change (→ extreme weather)
- Demographic change (→ adaptation needs)
- Mobility (→ general mobility; modal split)
- Management of natural and anthropogenic risks (→ flooding; mudslides)
- Increasingly scarce resources (→ construction material)
- Sustainable development (→ city planning and construction)

Development of Scenarios

Scenarios based on Development paths of social driving factors (→ till 2030)

- economical development, institutional framework conditions, demography, technical development, social systems of values

Business-as-usual (BAU)	Collective Responsibility (CR)	Market Individualism (MI)
Continuation of liberalization and privatization trends, persistence of strong market forces and weak public-regulation activities, continuation of existing social protection measures and subsidy schemes for the poorest.	Characterized by social and environmental justice as principal goals of public regulation, strong regulation of market activities and large public investments, together with the embedding of technologies in society and decoupling of socioeconomic development from resource use.	Increasing individual freedom and freedom of action; markets as the dominant vehicle for all societal transactions, together with resources and services generation and distribution strongly subject to supply and demand principles.

Urban Heat Island (UHI): Phenomena

- "Urban Heat Island" (UHI) refers to the tendency for a city or town (urbanized areas) to remain **warmer than its surroundings**.
- The **annual mean temperature** of a large city may be 1°–2°C warmer than the surrounding areas, and on individual calm, clear **nights** may be up to **12°C warmer** (→ Heat Island Intensity).
- **Closed isotherms** indicating an area of the surface (→ island) that is relatively warm; most commonly associated areas of human disturbance such as towns and cities (urbanized areas).
- The warmth extends vertically to form an **urban heat dome** in near calm, and an **urban heat plume** in more windy conditions.

UHI: Mitigation Measures ...

- **Increasing albedo**
reflectivity of surfaces / buildings, ...
- **Increasing vegetation cover**
green roofs, parks, avenue trees, ...
- **Decreasing runoff**
open water spaces, ponds, control of impervious surface areas, ...
- **Decreasing anthropogenic heating**
air conditioning, industrial facilities,
- **Increasing structural and natural shading**
ancient city structures

Overcoming the Scales

plot scale (chamber meas., remote sensing)

regional scale (ft meas.)

global scale (remote sensing)

...from measurements to modeling
...from the micro to the macro scale and vice versa (laboratory meas.)

71 Escuela Internacional de Desarrollo Sostenible
Medellín / Colombia - Octubre 31, 2017

Peter Suppan
KIT Campus Alpin
Garmisch-Partenkirchen / Germany

Summary

- A holistic and interdisciplinary approach is the main goal for a successful sustainable development of cities and a step forward for improving the air quality...
- ...but there is an absolute need of an in-depth research in each discipline
- Complex processes can only be described and assessed by multi-scale modeling
- Also the scenario development (mitigation & adaptation) needs multidisciplinary views and approaches
- High quality standards are needed not only for the urban level but also for the regional surrounding of cities

„It is now understood that the battle against climate change will likely be won - or lost - in cities.....targeted research at the city level is needed to enable policy makers to understand the magnitude of the impacts (World Bank 2008)
