# Quantitative and qualitative studies

Quantitative study	Qualitative study
 <p>students teachers</p> <p>→ two parallel surveys</p>	 <p>students</p> <p>→ selected interviews</p>
<ul style="list-style-type: none"> <li>• various didactic elements</li> <li>• judgments of their significance, expectations, reasons and attitudes towards undergraduate research and inquiry</li> </ul>	<ul style="list-style-type: none"> <li>• process experiences (referring to the development of an educational video)</li> <li>• perspectives on undergraduate research and inquiry</li> </ul>

# Is there empirical evidence for a famous model for undergraduate research and inquiry?

Figure 1.1: The nature of undergraduate research and inquiry

Source: Amended from Healey (2005, 70)

# Quantitative study: sample of teachers

N = 550 teachers

# Factor analysis

## teaching style

- factor 1: conducting research (experience with processes) (6 items,  $\alpha = ,912$ )
- factor 2: understanding research (examples, search, results) (5 Items,  $\alpha = ,831$ )

explained variance in %: fak. 1 = 55,170;  
fak. 2 = 9,538 / total 64,708)

# Quantitative study: sample of students

N=1482 students

## Factor analysis

- factor 1: learning with research processes  
(6 Items,  $\alpha = ,890$ ; Var. in % 47,204)
- factor 2: learning with research results  
(4 Items,  $\alpha = ,708$ ; Var. in % 13,449)

explained variance in % 60,652

# Teaching style / expectations towards students' learning

factor 1:  
metacognitive  
learning

factor 2:  
guided  
learning

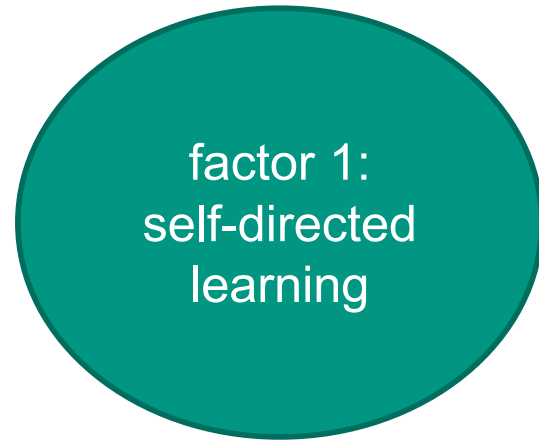

factor 3:  
self-directed  
learning

6 Items, $\alpha = ,840$	3 Items, $\alpha = ,651$	2 Items, $\alpha = ,624$
questioning attitude, follow their own questions, deep learning	learning through didactically well-developed material and optimal exam preparation	individual time for learning, learning through own mistakes
explained variance in %, fac. 1=41,628; fac.2=10,859; fac. 3=8,599; total: 61,087)		

## Uses / Learning expectations / learning style

**6 Items,  $\alpha = ,779$**

learning through own questions, own mistakes, own searching, individual time for learning

**5 Items,  $\alpha = ,718$**

optimal exam preparation, examples, learning through didactically well-developed material, practising and training

**6 Items,  $\alpha = ,718$**

acquiring overview, systematic structure, deep learning

explained variance in %, fac. 1=31,021; fac.2=12,719; fac. 3=7,666; total: 51,406)

### self-directed learning

*You underestimate the effort needed and you have to know that good communication and coordination in a group are needed to prepare such things. [...] **You have to try yourself out somehow and see in what direction it all goes and learn from things that did not go so well.** (Student B)*

*Well, you worked yourself into the functions very quickly. We did not get any help, though, **if we had questions like: “How does it work?” or “How can we install or integrate this?” We just had to find out for ourselves somehow.** (Student A)*

### guided learning

*I think it was a bit abstract at the beginning: You didn't really know what was expected of you, [...] when (the lecturer) showed the videos, I don't think that was -, that was just so far away. And then, to work it all out within only one semester ... **I would have wished that she had said a little more concretely what it was that she exactly wanted from us.** (Student B)*

***If we had known exactly how to approach a topic and work on it in such a medium, then I think we would have been much faster in committing ourselves to just that topic.** [...] We talked among the fellow students, and everyone kept on saying: "Now, what exactly are we supposed to do now. What are we to do with the topic, how big, how detailed, and so on should that topic be?" That was a bit difficult. (Student C)*

### metacognitive learning

*This became clearer to me through the change in perspective, exactly. Just try to put yourself in the position of the viewer, that's what it's all about. (Student C)*

*To say the truth, I had not yet really dealt with the topic. **But that was the attraction of it all. I said: "Okay, there again I have another field, a new field to learn about."** (Student C)*

*Yes, indeed, I learned again in that seminar that one questions oneself a little bit. Because, otherwise ... I can really only compare this with a textual work or literature research where you just go through it from beginning to end and where you are bound to some frame. You probably have already done this a hundred times but **you have never before created such a video and I think that's why you just have to be a lot more self-critical. And if it doesn't work out, then you have to change it again.** (Student B)*

## Guided learning style

predictors:

- rejection of independent learning/study
- learning as „understanding research content“
- slight depreciation of research-driven teaching
- dissatisfaction with the choice of the course/subject of study
- aspiration to making a career

## Metacognitive learning style

predictors:

- preference of both learning styles: learning as conducting research processes and learning as understanding research content
- clear interest in subject of study and discipline
- high level of motivation
- expectation to develop analytical skills
- appreciation of a research-driven curriculum

# Metacognitive learning style

coefficients <sup>a</sup>						
R <sup>2</sup> =,312		non-standardized coefficients		standardized coefficients	T	sig.
		B	standard-error	Beta		
pattern						
1	(constant)	2,512	0,712		3,530	0,000
	2.6 acquiring research methods	0,304	0,058	0,320	5,280	0,000
	2.11 deep learning	0,131	0,061	0,139	2,156	0,032
	2.12 critical use of information sources	0,119	0,055	0,137	2,183	0,030
	2.14 getting an overview over the subject	0,200	0,072	0,159	2,795	0,006

a. dependent variable: how important was the experience of conducting independently a research project? (N=266)

## Summary

What is important for research-driven teaching and learning?

- Metacognitive learning
- Experience of conducting independently a research project
- Interest in the subject matter/discipline

Obstructions for research-driven higher education:

- Expectations towards making a career (→ higher estimation is implicitly indicative for a different socialisation)
- Rejection of independent learning

# Further thinking

*Yes, I must admit ... I asked myself at the beginning, after the first few sessions: **What is the added value, what is the benefit for my studies?** Although ... certainly, my personal interest was awakened ..., partly. (Student C)*

***And then you ask how much do I have to do for these or other credits and how much do I have to do here or there. Meanwhile, everything is much more orderly, well-regulated, or predetermined and prescribed. So, this is somehow unusual, or, let me put it this way, it's not an everyday thing. (Student C)***

## Questions / discussion

**Thank you for your attention!**

## Research questions

- Which different learning styles, attitudes, expectations and motives of learning are evidenced by the empirical data?
- Which learning experiences through undergraduate research and inquiry are manifested in the qualitative and quantitative studies?
- What role does metacognition play for students' learning experience?

# factor analysis

Items (How important are the following didactic elements?)	factor 1	factor 2
conducting independently a research project	,889	
developing and planning a research project	,886	
developing research questions	,811	
running experiments/small projects	,810	
participating in the work of research projects at the institute/chair	,745	
exploring interrelations in a particular field	,776	,699
participating in excursions	,660	
using examples of research for illustration		,858
researching independently a certain theme (- research content)		,774
familiarising with current research results		,812
acquiring basic knowledge		,683

## Teaching style / expectations towards students' learning

- factor 1: questioning attitude, follow their own questions, deep learning → **metacognitive learning**  
(6 Items,  $\alpha = ,840$ )
- factor 2: learning through didactically well-developed material and optimal exam preparation → **guided learning**  
(3 Items,  $\alpha = ,651$ )
- factor 3: individual time for learning, learning through own mistakes (2 Items,  $\alpha = ,624$ ) → **self-directed learning**

explained variance in %, fac. 1=41,628; fac.2=10,859; fac. 3=8,599; total: 61,087)

## Uses/ Learning expectations/ learning style

- factor 1: learning through own questions, own mistakes, own searching, individual time for learning  
(6 Items,  $\alpha = ,779$ ; Var. in % 31,021) → self-directed learning
- factor 2: optimal exam preparation, examples, learning through didactically well-developed material, practising and training  
(5 Items,  $\alpha = ,718$ ; Var. in % 12,719) → guided learning
- factor 3: acquiring overview, systematic structure, deep learning  
(6 Items,  $\alpha = ,718$ ; Var. in % 7,666) → metacognitive learning

explained variance in % 51,406

## 4) Differences according to experience – U-Test

## 4) Differences according to experience

Mann-Whitney U-Test – conducting independently a research project Yes or no			
Importance of experience			
	<i>U</i>	<i>z</i>	<i>p</i>
researching independently a certain theme (- research content)	113753,50	-3,45	0,00*
familiarising with current research results	73742,00	-3,55	0,00*
using examples of research for illustration	83947,00	-1,80	0,07
participating in the work of research projects at the institute/chair	29092,00	-2,47	0,01*
developing research questions	14057,50	-3,50	0,00*
running experiments/small projects	56057,00	-3,90	0,00*
developing and planning a research project	2963,50	-1,63	0,10
exploring interrelations in a particular field	35061,50	-5,26	0,00*
participating in excursions	58058,00	-.834	0,40
acquiring basic knowledge/foundational knowledge	72545,00	-1,61	0,10

\* $p < 0.05$ ;  $U$  = Mann-Whitney U.

# Lehrstil: Forschung durchführen

## Deskriptive Statistiken

Abhängige Variable:

Score\_Forschung\_durchführen

5.1 Wie lange sind Sie schon in der akademischen Lehre tätig?	Mittelwert	Standardabweichung	H
0-3 Jahre	8,7428	1,90212	116
4-7 Jahre	8,8426	1,94692	90
8-11 Jahre	9,1932	1,83173	44
12-15 Jahre	9,3651	1,88103	42
16 und mehr Jahre	9,3882	1,74796	79
Gesamtsumme	9,0283	1,88152	371

Leichter Anstieg über die Klassen (Jahren an Lehrerfahrung).

# Lehrstil: Forschung verstehen

## Deskriptive Statistiken

Abhängige Variable: Score\_Forschung\_verstehen

5.1 Wie lange sind Sie schon in der akademischen Lehre tätig?	Mittelwert	Standardabweichung	H
0-3 Jahre	9,7277	1,15416	130
4-7 Jahre	9,6594	1,57418	101
8-11 Jahre	9,8863	1,19683	51
12-15 Jahre	10,1792	1,25018	48
16 und mehr Jahre	10,2440	1,06658	91
Gesamtsumme	9,8936	1,28296	421

Varianzanalyse ist im 2. Fall signifikant, aber die Effektstärke ist gering.

## 4) Duration of teaching

Modellzusammenfassung						
Modell	R	R-Quadrat	Korrigiertes R-Quadrat	Standardfehler des Schätzers		
1	,319 <sup>a</sup>	0,102	0,095	1,45833
