McSAFE

High Performance Monte Carlo for Safety

A Collision-based Domain Decomposition scheme for Serpent2

Manuel García, Karlsruhe Institute of Technology (KIT)

Motivation: the McSAFE EU project

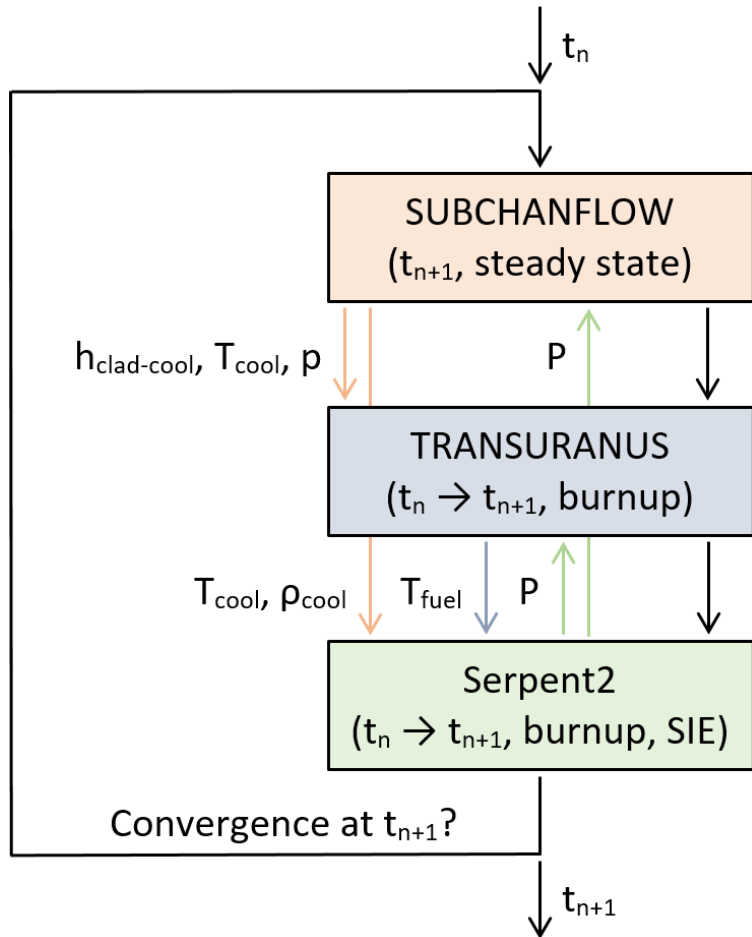

- Participants:
 - 9 research institutions: KIT, VTT, HZDR, JRC, CEA, NRI, KTH, AMEC, DNC.
 - 3 industry partners: EKK, CEZ, EdF.
- High-fidelity multiphysics for safety analysis of LWRs:
 - Monte Carlo neutron transport: Serpent2, Tripoli4, MCNP, MONK.
 - Subchannel thermalhydraulics: SUBCHANFLOW (SCF).
 - Fuel-performance analysis: TRANSURANUS (TU).
- Main developments:
 - Implementation of a Serpent2-SCF(-TU) coupling for steady-state, burnup and transient problems.
 - Optimization of steady-state and transient capabilities for HPC.
 - Optimization for massive (full-core) depletion problems.
- Validation with plant data:
 - PWR-Konvoi.
 - VVER-1000.

Current capabilities: pin-by-pin depletion

- Fully coupled pin-by-pin depletion:

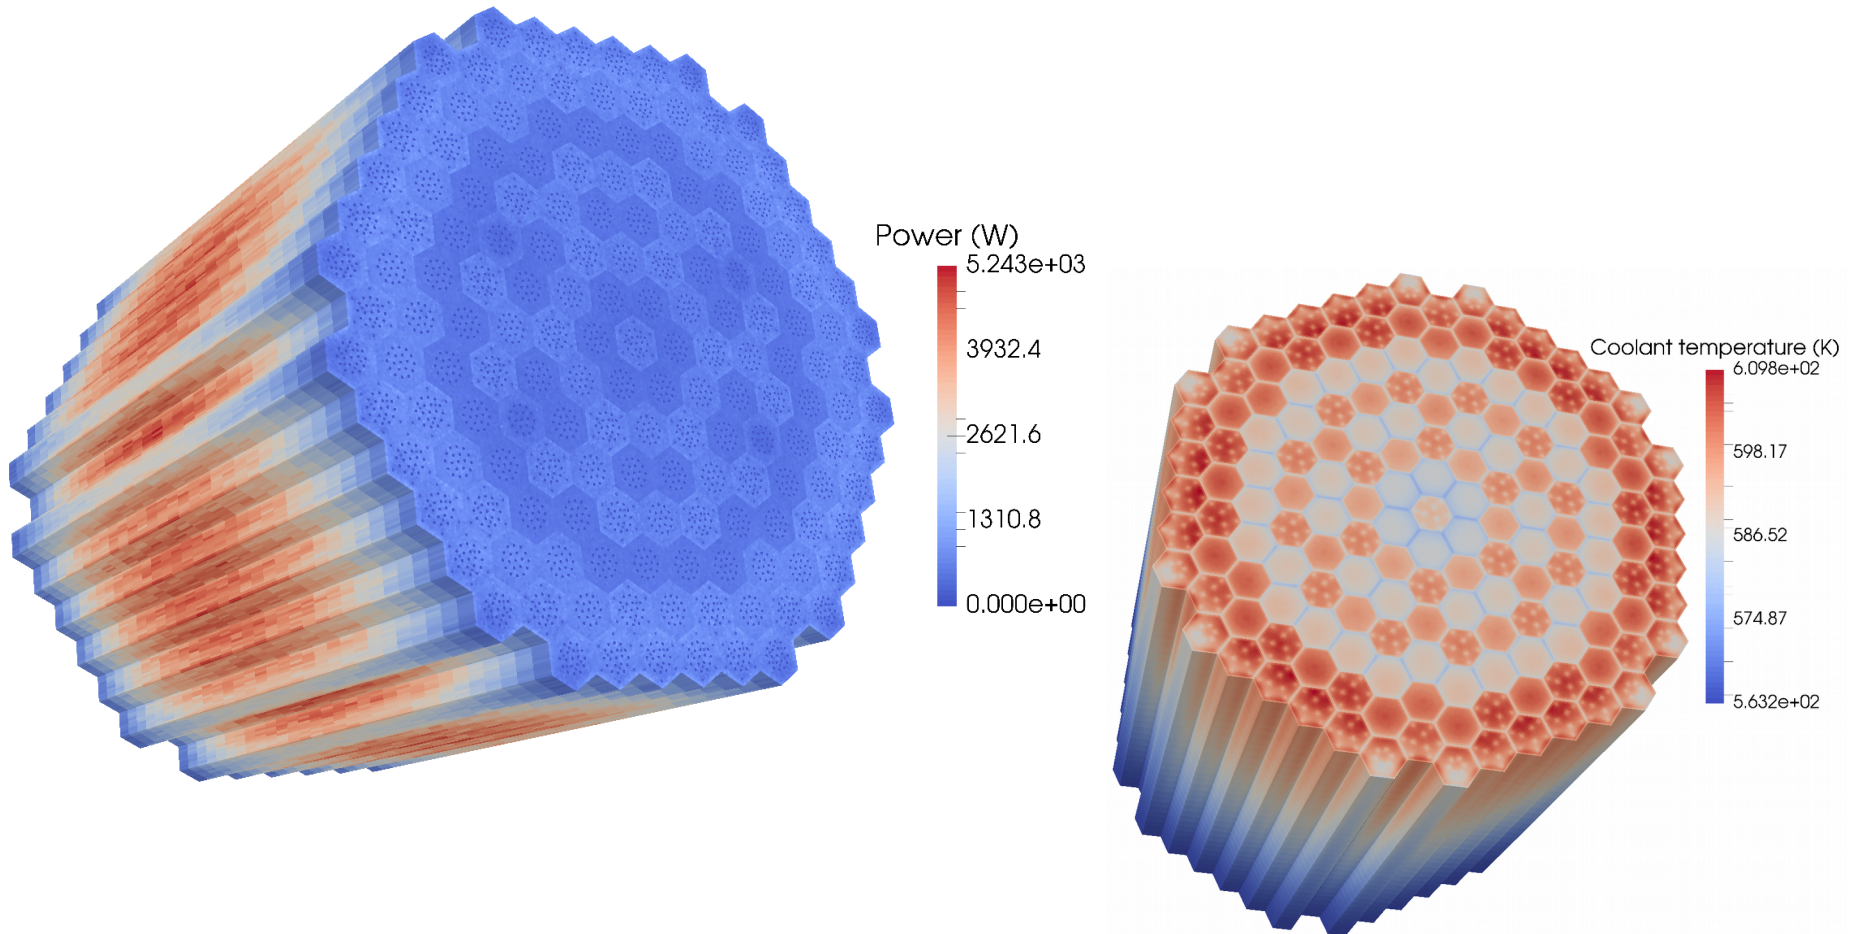

Current capabilities: full-core steady state

- Full-core steady-state (no burnup) calculations:

Next step: full-core pin-by-pin depletion

H2020

McSAFE

High Performance Monte Carlo for Safety

■ Main challenges:

- Calculation time ($\sim 10^9$ particles) \rightarrow optimizations in Serpent2, SCF and TU.
- Memory demand (\sim TB) \rightarrow domain decomposition for Serpent2.

Parallelization of Monte Carlo transport

- Particle-based parallelism:
 - Particle histories are independent and can be calculated simultaneously.
 - Natural algorithm, embarrassingly parallel (not really).
 - Domain replication across MPI tasks, shared memory in OpenMP.
 - Typically very good speedup, but no memory scalability.
- Domain decomposition:
 - Geometry divided in domains somehow.
 - Particle histories are still independent, so particle-based parallelism is used.
 - Tracking algorithm more complex due to particles changing domains (if no approximations are introduced).
 - Domain decomposition across MPI tasks, shared memory in OpenMP.
 - Potentially poorer speedup, but memory scalability.
 - The decomposition of the geometry (CSG) can be quite challenging.
 - A few implementations done lately (OpenMC, RMC).

Collision-based Domain Decomposition

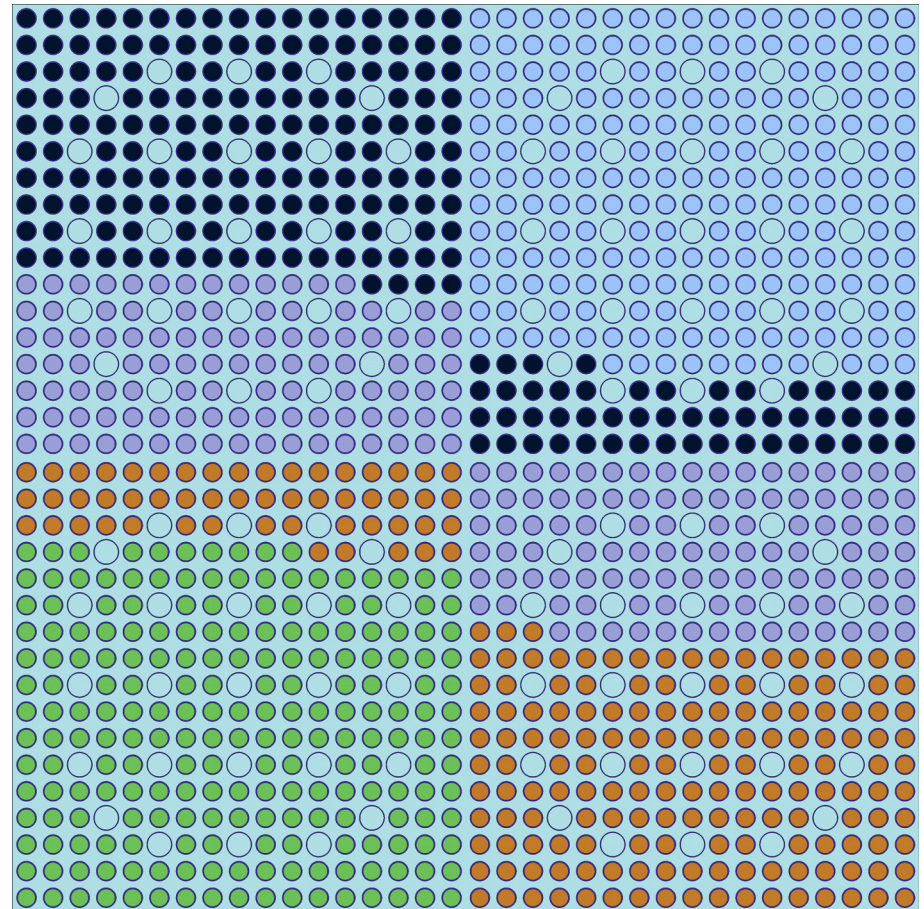

- Basic idea:
 - Divide burnable materials in domains (~ data decomposition).
 - Replicate non-burnable materials in all domains.
 - Each MPI task represents a domain.
- Particle tracking:
 - Neutrons created in each domain in local fissile materials.
 - Particles tracked until absorbed or leaked, or until a collision in a non-local material occurs.
 - Particles buffered and sent across domains.
 - A transport cycle is completed when all particle histories in the whole system are finished.

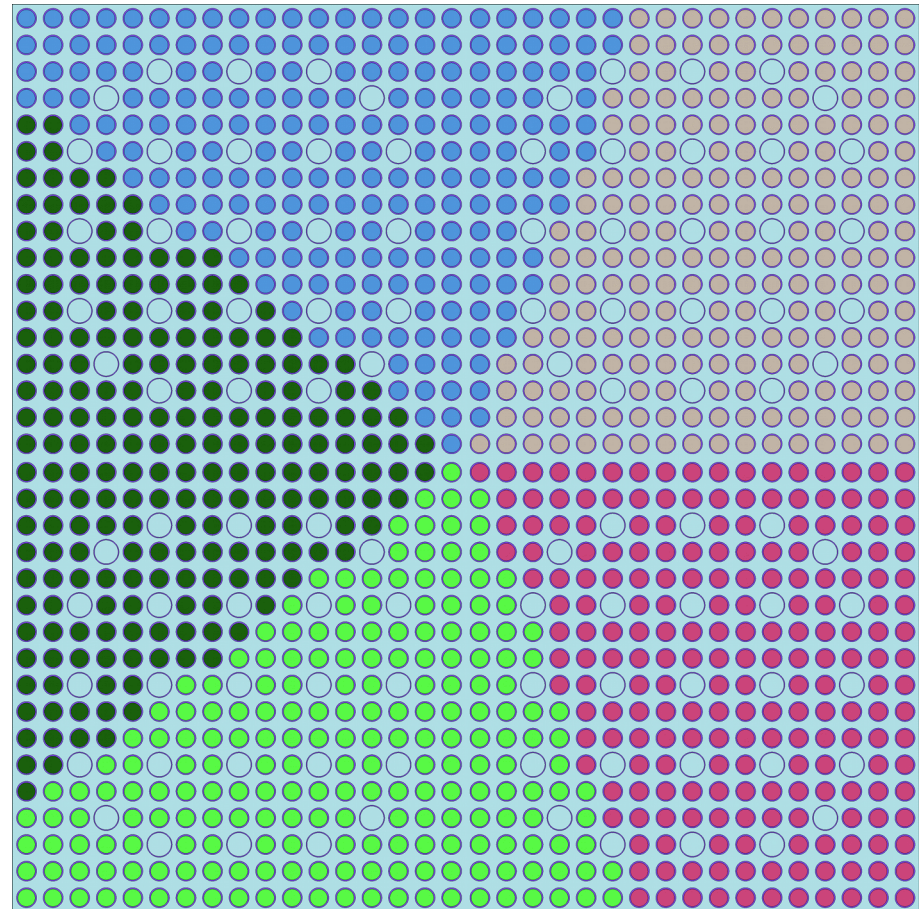

- Implemented options:
 - By material index (set dd 1).

- Implemented options:
 - By material index (set dd 1).
 - By angular sector (set dd 2).

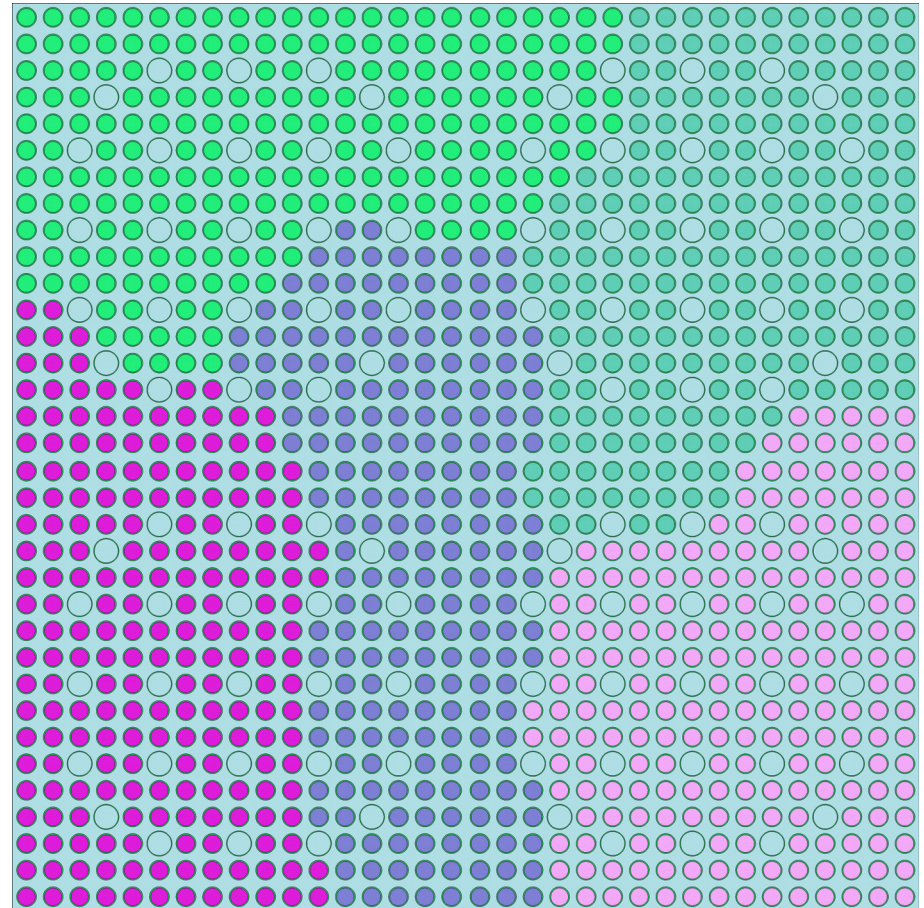

- Implemented options:
 - By material index (set dd 1).
 - By angular sector (set dd 2).
 - By angular sector with a central zone (set dd 3).

- Implemented options:
 - By material index (set dd 1).
 - By angular sector (set dd 2).
 - By angular sector with a central zone (set dd 3).
 - By graph partition (set dd 4).
- Graph-based division:
 - Material graph:
 - Vertices: materials.
 - Edges: material connections with cutoff maximum distance.
 - Weights: inverse of the distance.
 - Cartesian mesh to avoid comparing all materials ($O(n^2)$).
 - Partition done with Metis.

Tracking algorithm

- Particle transfers:
 - Particles are sent across domains when collisions in non-local materials occur.
 - Buffers used to send particles in larger messages.
 - Asynchronous communications (MPI_Isend(), MPI_Irecv()).
 - Direct task-to-task messages.
- Termination control:
 - All histories in the whole system need to be completed.
 - Tricky due to the use of asynchronous communications.
 - Stopping criteria: all local particles tracked, all messages sent received.
 - Two step calculation of the particle balance:
 - Asynchronous reduction to get an estimation.
 - Synchronous reduction to make sure.
 - Binary tree to handle collective communications.
