Abstract: New catalysts for important C–N bond formation are highly sought after. In this work, we demonstrate the synthesis and viability of a new class of planar chiral [2.2]paracyclophane-based bisoxazoline (BOX) ligands for the copper-catalyzed N–H insertion of α-diazocarbonyls into anilines. The reaction features a wide substrate scope and moderate to excellent yields, and delivers the valuable products at ambient conditions.

Keywords: [2.2]paracyclophane ligands; N–H insertion; α-diazocarbonyls; planar chirality; copper catalysis

1. Introduction

The copper-catalyzed N–H insertion of carbenoids such as easily prepared α-diazocarbonyls is a powerful method for the preparation of highly valuable bioactive molecules and pharmaceutical products [1]. In the past decade, various enantioselective chelating ligands based on the bis(oxazoline) motifs have been established for this transformation (Figure 1) [2–8].

![Figure 1. Representative classes of bisoxazoline-containing N,N-ligand systems used in asymmetric catalysis.](https://www.mdpi.com/journal/molecules)

While SpiroBOX IV (Figure 1) combines axial chirality from the spiro backbone with the central chirality of the 2-substituted BOX moiety, [2.2]paracyclophane (PCP) exhibits planar chirality, which has previously demonstrated remarkable performance as planar chiral ligand or chiral catalyst in asymmetric catalysis [9]. Notable examples include the addition of alkyl, aryl, alkynyl, and alkenyl...
zinc reagents to aromatic and aliphatic aldehydes and imines that are catalyzed by PCP ligands[10–14]. The PCP core allows different substituents to be positioned regioselectively using carefully chosen reaction parameters [15]. PCP displays planar chirality if only one substituent is introduced to one of the two aromatic benzene rings (decks). If the other deck is substituted as well, especially with both substituents being identical, only the pseudo-ortho and pseudo-meta PCP exhibit chirality, as the other two PCP isomers show higher symmetry (Figure 2) [15]. Thus, the pseudo-ortho PCP isomer is the most suitable for a chelating BOX ligand with PCP as the backbone – referred to here as [2.2]paracyclophane-based bisoxazoline (PCPBOX).

**Figure 2.** Achiral and chiral isomers of homodisubstituted PCP with the substituents on different decks. The pseudo-ortho isomer is the most suitable candidate for PCPBOX ligands.

Mukai et al. recently reported on PCPphBOX that employed phenyl spacers bearing a sterically demanding substituent between PCP and BOX (Scheme 1). These PCPphBOX served as promising chiral ligands for the asymmetric copper-catalyzed inter- and intra-molecular aromatic O–H insertion reaction with up to 80% ee [16,17]. Mukai et al. additionally investigated PCPBOX ligands, with phenyl, biphenyl, and without the phenyl as spacer groups for comparative studies. We thus set out to explore the PCPBOX ligands in copper-catalyzed N–H insertion to expand on their versatility.

**Scheme 1.** The earlier work of Mukai et al. on copper-catalyzed O–H insertion reaction and this work on N–H insertion reaction.
2. Results

2.1. Synthesis

Access to pseudo-ortho disubstituted PCPs leads through the thermal or microwave-assisted isomerization of the easily accessible pseudo-para dibromide of PCP [18]. In this way, pseudo-ortho dibromide 2 was obtained in 70% yield. On this stage, chromatographic separation of the racemic 2 was achieved via a Chiralprak® AZ-H column (Scheme 2).

![Scheme 2. Preparation of enantiopure pseudo-ortho PCP dibromide 2 via microwave-assisted isomerization.](image)

The obtained (R)p-2 and (S)p-2 were subjected to a two-step lithiation-carboxylation procedure to afford the enantiopure carboxylic acids 3 (Scheme 3). However, while the conversion of (R)p-2 smoothly delivered (R)p-3 in good yield, the conversion of (S)p-2 left us with inconclusive results.

![Scheme 3. Conversion of the dibromo PCP to the dicarboxylic acid 3.](image)

With (R)p-3 in hand, we proceeded with the PCPBOX synthesis by subjecting it to condensation conditions with suitable amino alcohols to afford the respective hydroxyl amides. Under Appel conditions, cyclization and dehydration is achieved to afford the enantiopure PCPBOXs 4a–c in moderate to good yields (Scheme 4).
2.2. Catalysis

The synthesized PCPBOX ligands were tested in the copper-catalyzed N–H insertion reaction. The catalyst is generated in situ from ligand 4 and a rationally selected copper source. For the optimization of the copper source, the diastereomeric mixture \((S_p,S)/(R_p,S)\)-4 was used. The competition between N–H insertion and β-hydride elimination (BHE) leads to a mixture of desired product 7 and the olefinic product 8.

The initially tested Cu(MeCN)\(_4\)PF\(_6\) complex shows good selectivity (Table 1, entry 1). Simple copper (I) chloride does not deliver the desired product at all (entry 2). Lowering the temperature to room temperature increased the selectivity to an excellent ratio of 93:5 with Cu(MeCN)\(_4\)PF\(_6\) (entry 4). When β-hydrogen lacking 6b was used (entry 7–10), product 9 was detected from the dimerization of the α-diazocarbonyl 6b. Dropwise addition of 6b to the reaction mixture alleviated this issue for the most part. With these optimized reaction conditions, the same copper source (Cu(MeCN)\(_4\))PF\(_6\) leads to excellent yields of 98% for the desired product 7b. Notably, in both cases the product was formed even in the absence of the ligand 4 in 13% and 40% yield respectively.

The molecular structure of the N–H insertion product 7b was further confirmed unambiguously by single crystal X-Rays structure analysis (Figure 3, for further details see Electronic Supplementary Information and cif-file, CCDC 1962906 (7b) contains the supplementary crystallographic data for this paper. These data can be obtained free of charge from The Cambridge Crystallographic Data Centre via www.ccdc.cam.ac.uk/data_request/cif).

A series of other aniline derivatives and α-diazocarbonyls were investigated to further test the substrate scope for this reaction. A wide range of products were obtained in short reaction times and in good to excellent yields (Table 2). While unsubstituted phenyl rings as substituents gave the best yields (entry 2), benzyl substituents also delivered the product in very good yield (entries 3–8). However, a drop in yields was observed employing electron donating groups in the meta-position (entry 5). This contrasts with findings of Zhou et al. showing no such drop for similar substitution patterns [2]. If non-aromatic anilines were used, no product formation could be observed (entries 11–12).

* Isolated yields.

We turned our attention towards the enantioselective N–H insertion with unsaturated α-diazocarbonyls. The products of this reaction are valuable intermediates that can be used in the total synthesis of biologically important products such as Rostratin B–D [19]. The ligands discussed in Scheme 4 were tested with results summarized in Table 3. While only low yields of 22% were achieved with 5 mol% (R<sub>p</sub>,S)-4a (Table 3, entry 1), this could be increased to 38% by using 10 mol% ligand. Dramatically increased yields were observed for the more sterically demanding (R<sub>p</sub>,S)-4b and (R<sub>p</sub>,S)-4c (entry 3–4). All these enantiopure ligands did not induce any considerable enantioselectivity as determined by chiral HPLC. This further verifies the observations obtained by Mukai et al. that the combination of planar and central chirality in PCPBOX ligands suffers from very low enantioinduction [17].

3. Materials and Methods

Benzyl 2-diazopropanoate [20], Methyl 2-diazo-2-phenylacetate [21] and tert-Butyl 2-diazopropanoate [20] were prepared according to literature procedures.

4,16-Dibromo[2.2]paracyclophane (1)

A solution of Br₂ (5.50 mL, 17.0 g, 106 mmol, 2.2 equiv.) in CH₂Cl₂ (50 mL) was prepared. A suspension of iron powder (0.14 g, 2.4 mmol, 0.05 equiv.) in 6.25 mL of the Br₂/CH₂Cl₂ solution was diluted in 50 mL of CH₂Cl₂ and stirred at room temperature for 1 h. The solution was then brought to reflux for 2 h. CH₂Cl₂ (50 mL) and [2.2]paracyclophane (10.0 g, 48.0 mmol, 1.00 equiv.) were added to the mixture subsequently. After the remaining bromine solution was added dropwise over a period of 4 h, the mixture was stirred at room temperature for 3 d. Saturated Na₂S₂O₃ solution was added and the reaction mixture was stirred at room temperature until the bromine color disappeared. The organic phase was separated and filtrated, the precipitate was recrystallized from hot toluene to obtain the title product as an off-white solid, 5.40 g, 14.8 mmol, 31%.

1H-NMR (400 MHz, CDCl₃) δ/ppm = 7.14 (d, J = 7.8, 1.8 Hz, 2H, 2 × C₆ArH), 6.51 (d, J = 1.8 Hz, 2H, 2 × C₆ArH), 6.44 (d, J = 7.8 Hz, 2H, 2 × C₆ArH), 3.50 (ddd, J = 12.8, 10.3, 2.0 Hz, 2H, 2 × CH₂(PC)), 3.16 (ddd, J = 12.1, 10.2, 4.6 Hz, 2H, 2 × CH₂(PC)), 2.95 (ddd, J = 12.1, 11.4, 2.0 Hz, 2H, 2 × CH₂(PC)), 2.85 (ddd, J = 13.0, 10.6, 4.6 Hz, 2H, 2 × CH₂(PC)). 13C-NMR (101 MHz, CDCl₃) δ/ppm = 141.3 (C₆q, 2 × C₆Ar), 138.6 (C₆q, 2 × C₆Ar), 137.4 (+, CH, 2 × C₆Ar), 134.2 (+, CH, 2 × C₆Ar), 128.4 (+, CH, 2 × C₆Ar), 126.8 (C₆q, 2 × C₆Ar-Br), 35.5 (−, 2 × CH₂), 32.9 (−, 2 × CH₂). IR (ATR): δ/cm⁻¹ = 2932 (vw), 2849 (vw), 1895 (vw), 1583 (vw), 1532 (vw), 1474 (vw), 1449 (vw), 1432 (vw), 1390 (w), 1313 (vw), 1185 (vw), 1104 (vw), 1030 (w), 947 (w), 899 (w), 839 (w), 855 (w), 830 (w), 706 (w), 669 (w), 647 (w), 522 (vw), 464 (w), 393 (w).

MS (EI, 70 eV), m/z (%): 364/366/368 (3/6/3) [M⁺], 184/182 (18/18) [M – C₆H₂Br⁺], 104 (100) [C₆H₈]⁺. HRMS (EI, C₁₆H₁₄⁻Br₂) calc. 363.9457, found 363.9455.

(rac)-4,12-Dibromo[2.2]paracyclophane (rac)-2

In a 10 mL microwave vessel was placed 4,16-dibromo[2.2]paracyclophane (500 mg, 1.37 mmol, 1.00 equiv.) and DMF (1.00 mL). The device was programmed to heat the mixture to 180 °C. The mixture was stirred at room temperature until the bromine color disappeared. The mixture was filtered and the precipitate was recrystallized from hot toluene to obtain the title product as an off-white solid, 3.50 g, 9.65 mmol, 70%.

Rf = 0.68 (c-Hex/EtOAc = 9:1). 1H-NMR (400 MHz, CDCl₃) δ/ppm = 7.22 (d, J = 1.6 Hz, 2H, 2 × C₆ArH), 6.56 (d, J = 7.8 Hz, 2H, 2 × C₆ArH), 6.52 (dd, J = 7.9, 1.7 Hz, 2H, 2 × C₆ArH), 3.47 (ddd, J = 13.3, 9.6, 2.2 Hz, 2H, 2 × CH₂(PC)), 3.10 (ddd, J = 13.0, 9.6, 6.8 Hz, 2H, 2 × CH₂(PC)), 3.06–2.94 (m, 2H, 2 × CH₂(PC)), 2.82 (ddd, J = 13.3, 10.1, 6.9 Hz, 2H, 2 × CH₂(PC)). 13C-NMR (101 MHz, CDCl₃) δ/ppm = 141.3 (C₆q, 2 × C₆Ar), 138.7 (C₆q, 2 × C₆Ar), 135.0 (+, CH, 2 × C₆Ar), 132.7 (+, CH, 2 × C₆Ar), 131.7 (+, CH, 2 × C₆Ar), 126.7 (C₆q, 2 × C₆Ar-Br), 35.8 (−, 2 × CH₂), 32.5 (−, 2 × CH₂). IR (ATR): δ/cm⁻¹ = 2923 (w), 2848 (w), 1583 (w), 1537 (w), 1474 (w), 1449 (w), 1431 (w), 1391 (m), 1272 (w), 1237 (w), 1201 (w), 1185 (w), 1030 (m), 902 (m), 858 (m), 875 (w), 705 (m), 644 (m), 475 (m). MS (70 eV, EI) m/z (%): 368/366/364 (22/43/22) [M⁺], 288/286 (13/12) [M – H – Br⁺], 184/182 (80/100) [M – C₆H₄Br⁺], 104 (68) [C₆H₈]⁺. HRMS (EI, C₁₆H₁₄⁻Br₂) calc. 363.9462, found 363.9461.

3.2.4,12-Dibromo[2.2]paracyclophane (Rp)-2 / (Sp)-4,12-Dibromo[2.2]paracyclophane (Sp)-2

Separation of (rac)-4,12-dibromo[2.2]paracyclophane (2) was performed by semi-preparative chiral HPLC. For details see Electronic Supporting Information.
(R_p)-4,12-Dicarboxy[2.2]paracyclophane (R_p-3)

To a solution of (R_p)-4,12-dibromo[2.2]paracyclophane (1.50 g, 4.12 mmol, 1.00 equiv.) in abs. THF (50 mL) was added 9.71 mL of t-butyllithium (1.7 M in pentane, 15.4 mmol, 4.00 equiv.) dropwise at −78 °C. After stirring at −78 °C for 3 h, CO_2 was bubbled through the solution via a long needle under stirring for 2 h. The reaction mixture was then quenched with water and extracted with 1 M NaOH solution (2 × 100 mL). The water phases were combined, washed with CH_2Cl_2 (50 mL) and acidified with 6 M HCl until the solution tested acidic by litmus paper. The precipitate was filtrated, washed with water and CH_2Cl_2. The title product was obtained after drying under high vacuum as white powder, 640 mg, 3.14 mmol, 52%.

[α]_D^{20} = −134 (c = 0.00203, EtOH). 1H-NMR (400 MHz, DMSO-d_6) δ/ppm = 12.4 (s, 2H, CH, 2 × COOH), 7.04 (d, J = 2.0 Hz, 2H, 2 × C_ArH), 6.78 (dd, J = 7.8, 1.9 Hz, 2H, 2 × C_ArH), 6.60 (d, J = 7.8 Hz, 2H, 2 × C_ArH), 4.04–3.88 (m, 2H, 2 × C_ArH), 3.15 (dd, J = 12.5, 9.8 Hz, 2H, 2 × C_ArH), 2.98 (ddd, J = 12.5, 9.6, 7.3 Hz, 2H, 2 × C_ArH), 2.81 (ddd, J = 12.3, 9.8, 7.3 Hz, 2H, 2 × C_ArH). 13C-NMR (101 MHz, DMSO-d_6) δ/ppm = 167.7 (C_q, 2 × COOH), 141.9 (C_q, 2 × C_Ar), 139.7 (C_q, 2 × C_Ar), 136.1 (+, CH, 2 × C_Ar), 135.9 (+, CH, 2 × C_Ar), 133.3 (+, CH, 2 × C_Ar), 130.7 (C_q, 2 × C_Ar-COOH), 35.3 (−, CH_2, 2 × C_PC), 33.7 (−, CH_2, 2 × C_PC). IR (ATR): ν/cm⁻¹ = 2925 (w), 1674 (w), 1592 (w), 1556 (w), 1489 (vw), 1422 (w), 1300 (w), 1273 (w), 1203 (w), 1074 (w), 909 (w), 850 (vw), 797 (vw), 759 (vw), 717 (vw), 664 (w), 631 (w), 555 (vw), 518 (w), 426 (vw). MS (70 eV, EI) m/z (%): 296 (27) [M]⁺, 278 (100) [MH2O]⁺, 148 (83) [MCuH6O2]⁺. HRMS (EI, C_{18}H_{16}O_{4}) calc. 296.1049, found 296.1049. The analytical data match those reported in the literature [22].

(R_p,S)-4,12-Bis(4′-isopropylxazolin-2′-yl)[2.2]paracyclophane (R_p,S)-4a

Thionyl chloride (1.0 mL) was added to (R_p,S)-4,12-dicarboxy[2.2]paracyclophane (250 mg, 0.840 mmol, 1.00 equiv.) and the resulting mixture was stirred at 100 °C for 90 min. After cooling to room temperature, the excess thionyl chloride was removed under vacuum, the final traces were washed with toluene (2 × 2 mL) and removed under vacuum. The resulting crude acetyl chloride was dissolved in CH_2Cl_2 (5 mL) and cooled to 0 °C. A solution of S-Valinol (0.350 g, 3.36 mmol, 4.00 equiv.) and Et_3N (0.54 mL, 0.42 g, 4.20 mmol, 5.00 equiv.) in CH_2Cl_2 (1.0 mL) was added, the reaction mixture was allowed to warm to room temperature and stirred for 24 h. 10 mL of CH_2Cl_2 was then added and the solution was washed with aq. NaHCO_3 solution (3.5% w/v, 2 × 10 mL) and brine (20 mL). The organic phase was dried over MgSO_4, filtered, concentrated, and dried under vacuum to give the crude amide as light brown solid.

The crude amide was dissolved in CH_3CN (5.0 mL), PPh_3 (0.66 g, 2.52 mmol, 3.00 equiv.), CCl_4 (0.770 mL, 1.23 g, 7.98 mmol, 9.50 equiv.) and Et_3N (0.970 mL, 0.760 g, 7.56 mmol, 9.00 equiv.) were added subsequently. After stirring at room temperature overnight, the solvent was removed under reduced pressure, the resulting mixture was dissolved in CH_2Cl_2 and washed with H_2O (2 × 10 mL), the combined organic phase was washed with brine, dried over Na_2SO_4, filtered and concentrated under vacuum. The crude was purified via column chromatography (c-Hex/EtOAc = 9:1) to give the title product as a pale yellow solid, 0.150 g, 0.350 mmol, 42%.

R_f = 0.34 (c-Hex/EtOAc = 9:1). 1H-NMR (400 MHz, CDCl_3) δ/ppm = 7.09 (d, J = 1.9 Hz, 2H, 2 × C_ArH), 6.62 (dd, J = 7.9, 1.9 Hz, 2H, 2 × C_ArH), 6.54 (d, J = 7.8 Hz, 2H, 2 × C_ArH), 4.37 (ddd, J = 11.2, 9.5, 2.0 Hz, 2H, 2 × CH_Pc), 4.30 (dd, J = 5.8, 2.2 Hz, 2H, 2 × CH^5), 4.04 (ddd, J = 8.6, 6.7 Hz, 2H, 2 × CH^4), 4.05–3.92 (m, 2H, 2 × CH^5), 3.24–3.16 (m, 2H, 2 × CH_Pc), 3.16–3.07 (m, 2H, 2 × CH_Pc), 2.82 (ddd, J = 12.6, 10.0, 7.1 Hz, 2H, 2 × CH_Pc), 1.95 (hept, J = 6.7 Hz, 2H, 2 × CH^6), 1.20 (d, J = 6.7 Hz, 6H, CH^7), 1.06 (d, J = 6.7 Hz, 6H, CH^7). 13C-NMR (101 MHz, CDCl_3) δ/ppm = 162.9 (C_q, 2 × C^2), 141.0 (C_q, 2 × C_Ar), 140.1 (C_q, 2 × C_Ar), 135.8 (+, CH, 2 × C_Ar), 134.8 (+, CH, 2 × C_Ar), 132.3 (+, CH, 2 × C_Ar), 128.2 (C_q, 2 × C_Ar), 73.8 (+, CH, 2 × C^6), 69.3 (−, CH_2, 2 × C^5), 35.8 (−, CH_2, 2 × C^5PC), 33.6 (+, CH, 2 × C^6), 33.6 (−, CH_2, 2 × C^5PC), 19.7 (−, CH_2, 2 × C^7), 19.2 (+, CH_3, 2 × C^7). IR (ATR): ν/cm⁻¹ = 2951 (w), 1637 (m), 1590 (w), 1492 (w), 1468 (w), 1429 (w), 1384 (w), 1346 (w), 1303 (w), 1275 (w), 1258 (w), 1191 (w), 1172 (w), 1137 (w), 1115 (w), 1053 (m), 1026 (w), 984 (m), 933 (w), 907 (m), 889 (w), 822 (w), 749 (w), 624 (w), 605 (w), 576 (w), 466 (w), 441 (w), 411 (w), 390 (m), 363 (m), 344 (w), 327 (w).
Thionyl chloride (2.0 mL) was added to \((R_p)-4,12\text{-dicarboxy}[2.2]\text{paracyclopane} (0.150 \text{ g}, 0.510 \text{ mmol}, 1.00 \text{ equiv.}), after stirring at room temperature for 10 min, the mixture was heated to 100 °C and stirred at this temperature for 90 min. The excess thionyl chloride was removed by evaporation, the final traces were washed with toluene (2 × 2 mL). After drying under vacuum, the resulting crude acid chloride was dissolved in abs. CHCl\(_3\) (5 mL) and cooled to 0 °C. A solution of \((S)-(+)\text{-tert-leucinol} (0.229 \text{ g}, 2.04 \text{ mmol}, 4.00 \text{ equiv.}) and abs. Et\(_3\)N (0.260 g, 0.360 mL, 2.55 mmol, 5.00 equiv.) in CH\(_2\)Cl\(_2\) (1.0 mL) was added and the reaction mixture allowed to warm to room temperature and stirred for 24 h. Water was then added (10 mL) and extracted with CH\(_2\)Cl\(_2\) (3 × 10 mL), the combined organic phase was washed with sat. NaHCO\(_3\) and stirred under this temperature for 90 min. The excess thionyl chloride was removed by evaporation and the final traces were washed with toluene (2 mL). After drying under vacuum, the resulting crude was dissolved in abs. CHCl\(_3\) (8.00 mL) and stirred under this temperature for 90 min. The excess thionyl chloride was removed by evaporation, the final traces were washed with toluene (2 mL). After drying under vacuum, the crude was purified via column chromatography (CH\(_2\)Cl\(_2\)/MeOH = 98:2 → 95:5) to give the intermediate amide. To a solution of this amide (152 mg, 0.307 mmol, 1.00 equiv.) and PPh\(_3\) (282 mg, 1.08 mmol, 3.50 equiv.) in abs. CH\(_2\)Cl\(_2\) (344 mg, 1.31 mmol, 5.00 equiv.) in abs. CH\(_2\)Cl\(_2\) (1 mL) was added and the reaction mixture allowed to warm to room temperature and washed with brine, the organic phase was dried over Na\(_2\)SO\(_4\), filtered, concentrated and dried under vacuum. The crude was purified via column chromatography (c-Hex/EtOAc = 9:1) to give the title product as colorless solid, 104 mg, 0.227 mmol, 44% over two steps.

Methyl 2-Phenyl-2-(phenylamino)acetate (7a)

General procedure (GP) was followed by adding phenyl-2-diazopropionate (17.6 mg, 0.10 mmol, 1.00 equiv.) and aniline (11.2 mg, 1.20 mmol, 1.20 equiv.) to a suspension of in situ generated Cu-(R₆p,S)-4a catalyst. The product 7a was obtained via flash chromatography (c-Hex/EtOAc = 5:1) as colorless solid, 23.6 mg, 0.98 mmol, 98%.

¹H-NMR (300 MHz, CDCl₃) δ/ppm = 7.42 (d, J = 7.7 Hz, 2H, 2 × C₆H₄), 7.27 (qd, J = 7.5, 6.4, 2.6 Hz, 3H, 3 × C₆H₄), 7.04 (t, J = 7.9 Hz, 2H, 2 × C₆H₄), 6.62 (t, J = 7.3 Hz, 1H, C₆H₄), 6.48 (d, J = 7.7 Hz, 2H, 2 × C₆H₄), 5.01 (d, J = 5.9 Hz, 1H, CHN), 4.88 (s, 1H, NH), 3.65 (s, 3H, OCH₃).

The analytical data matches the data reported in the literature [23].

Methyl 2-phenyl-2-(phenylamino)acetate (7b)

GP was followed by adding phenyl-2-diazopropionate (17.6 mg, 0.10 mmol, 1.00 equiv.) and aniline (11.2 mg, 1.20 mmol, 1.20 equiv.) to a suspension of in situ generated Cu-(R₆p,S)-4a catalyst. The product 7b was obtained via flash chromatography (c-Hex/EtOAc = 5:1) as colorless solid, 23.6 mg, 0.98 mmol, 98%.

¹H-NMR (300 MHz, CDCl₃) δ/ppm = 7.42 (d, J = 7.7 Hz, 2H, 2 × C₆H₄), 7.27 (qd, J = 7.5, 6.4, 2.6 Hz, 3H, 3 × C₆H₄), 7.04 (t, J = 7.9 Hz, 2H, 2 × C₆H₄), 6.62 (t, J = 7.3 Hz, 1H, C₆H₄), 6.48 (d, J = 7.7 Hz, 2H, 2 × C₆H₄), 5.01 (d, J = 5.9 Hz, 1H, CHN), 4.88 (s, 1H, NH), 3.65 (s, 3H, OCH₃).

The analytical data matches the data reported in the literature [23].

General Procedure (GP): Copper-Catalyzed N–H Insertion

Cu(MeCN)₄PF₆ (5 mol%), ligand (6 mol%) and NaBARF (6 mol%) were added into an oven-dried screw vial, evacuated, and backfilled with argon three times. After CH₂Cl₂ (1 mL) was injected into the vial, the solution was stirred at 40 °C under argon atmosphere overnight. A solution of α-diazopropanoates (1.00 equiv.) and aniline (1.20 equiv.) in CH₂Cl₂ (1 mL) was added dropwise, the mixture was stirred at room temperature for 2 h. The resulting mixture was dried under vacuum and purified via column chromatography (c-Hex/EtOAc = 8:1 or pentane/Et₂O = 5:1) to give the products 7a–j.

Benzyl phenylalaninate (7c)

GP was followed by adding benzyl 2-diazopropanoate (19.0 mg, 0.10 mmol, 1.00 equiv.) and aniline (11.2 mg, 1.20 mmol, 1.20 equiv.) to a suspension of in situ generated Cu-(R₆p,S)-4a catalyst. The product was obtained as a light-yellow solid (c-Hex/EtOAc = 4:1), 23.9 mg, 0.94 mmol, 94%. 
$R_f = 0.33$ (c-Hex/EtOAc = 5:1). $^1$H-NMR (300 MHz, CDCl$_3$) $\delta$/ppm = 7.31–7.16 (m, 5H, CH$_2$Ph), 7.15–7.02 (m, 2H, 2 × C$_6$H$_4$), 6.73 (tt, $J = 7.3$, 1.1 Hz, 1H, C$_6$H$_4$), 6.63 (dd, $J = 8.6$, 1.2 Hz, 2H, 2 × C$_6$H$_4$), 5.07 (s, 2H, CH$_2$Ph), 4.14 (q, $J = 7.0$ Hz, 1H, CHN), 3.98 (s, 1H, NH), 1.42 (d, $J = 7.0$ Hz, 3H, CHCH$_3$).

The analytical data matches the data reported in the literature[24].

**Benzyl (2-methoxyphenyl)alaninate (7d)**

GP was followed by adding benzyl 2-diazopropanoate (19.0 mg, 1.00 mmol, 1.00 equiv.) and o-anisidine (14.8 mg, 1.20 mmol, 1.20 equiv.) to a suspension of in situ generated Cu-(R$_5$S)4a catalyst. The product was obtained via column chromatography (c-Hex/EtOAc = 5:1) as a light-yellow solid, 23.3 mg, 0.82 mmol, 82%.

$^1$H-NMR (300 MHz, CDCl$_3$) $\delta$/ppm = 7.40–7.06 (m, 5H, CH$_2$Ph), 6.78–6.66 (m, 2H, 2 × C$_6$H$_4$), 6.62 (ddd, $J = 8.2$, 7.2, 1.6 Hz, 1H, C$_6$H$_4$), 6.44 (dd, $J = 7.6$, 1.6 Hz, 1H, C$_6$H$_4$), 5.07 (s, 2H, CH$_2$Ph), 4.64 (s, 1H, NH), 4.12 (q, $J = 7.0$ Hz, 1H, CHN), 3.76 (s, 3H, OCH$_3$), 1.44 (d, $J = 6.9$ Hz, 3H, CHCH$_3$). $^{13}$C-NMR (75 MHz, CDCl$_3$) $\delta$/ppm = 174.5 (C$_q$, CO$_2$Bn), 147.2 (C$_q$, C$_{Ar}$), 136.6 (C$_q$, C$_{Ar}$), 135.8 (C$_q$, C$_{Ar}$), 128.6 (+, CH, 2 × C$_{Ar}$), 128.3 (+, CH, C$_{Ar}$), 128.2 (+, CH, 2 × C$_{Ar}$), 121.3 (+, CH, C$_{Ar}$), 117.7 (+, CH, C$_{Ar}$), 110.6 (+, CH, C$_{Ar}$), 109.9 (+, CH, C$_{Ar}$), 66.8 (−, CH$_2$, CH$_2$Ph), 55.5 (+, CH$_3$, OCH$_3$), 52.0 (+, CH, CHN), 18.9 (+, CH$_3$).

The analytical data matches the data reported in the literature[24].

**Benzyl (3-Methoxyphenyl)alaninate (7e)**

GP was followed by adding benzyl 2-diazopropanoate (19.0 mg, 1.00 mmol, 1.00 equiv.) and m-anisidine (14.8 mg, 1.20 mmol, 1.20 equiv.) to a suspension of in situ generated Cu-(R$_5$S)4a catalyst. The product was obtained via column chromatography (c-Hex/EtOAc = 5:1) as light-yellow solid, 15.1 mg, 53%.

$^1$H-NMR (300 MHz, CDCl$_3$) $\delta$/ppm = 7.39–7.27 (m, 5H, CH$_2$Ph), 7.07 (t, $J = 8.1$ Hz, 1H, C$_6$H$_4$), 6.32 (dd, $J = 8.2$, 2.3 Hz, 1H, C$_6$H$_4$), 6.25–6.19 (m, 1H, C$_6$H$_4$), 6.16 (t, $J = 2.3$ Hz, 1H, C$_6$H$_4$), 5.16 (s, 2H, CH$_2$Ph), 4.19 (q, $J = 6.9$ Hz, 1H, CHN), 3.74 (s, 1H, NH), 1.48 (d, $J = 6.9$ Hz, 3H, CHCH$_3$). $^{13}$C-NMR (75 MHz, CDCl$_3$) $\delta$/ppm = 174.3 (C$_q$, CO$_2$Bn), 160.8 (C$_q$, C$_{Ar}$), 147.9 (C$_q$, C$_{Ar}$), 135.5 (C$_q$, C$_{Ar}$), 130.1 (+, CH, C$_{Ar}$), 128.5 (+, CH, 2 × C$_{Ar}$), 128.3 (+, CH, C$_{Ar}$), 128.1 (+, CH, 2 × C$_{Ar}$), 106.3 (+, CH, C$_{Ar}$), 103.7 (+, CH, C$_{Ar}$), 99.5 (+, CH, C$_{Ar}$), 66.8 (−, CH$_2$, CH$_2$Ph), 55.0 (+, CH$_3$, OCH$_3$), 52.0 (+, CH, CHN), 18.8 (+, CH$_3$).

**Benzyl (4-Methoxyphenyl)alaninate (7f)**

GP was followed by adding benzyl 2-diazopropanoate (19.0 mg, 1.00 mmol, 1.00 equiv.) and p-anisidine (14.8 mg, 1.20 mmol, 1.20 equiv.) to a suspension of in situ generated Cu-(R$_5$S)4a catalyst. The product was obtained via column chromatography (c-Hex/EtOAc = 4:1) as light-yellow solid, 20.0 mg, 70%.

$^1$H-NMR (300 MHz, CDCl$_3$) $\delta$/ppm = 7.38–7.03 (m, 5H, CH$_2$Ph), 6.72–6.61 (m, 2H, 2 × C$_6$H$_4$), 6.51 (d, $J = 9.0$ Hz, 2H, 2 × C$_6$H$_4$), 5.06 (s, 2H, CH$_2$Ph), 4.04 (q, $J = 6.9$ Hz, 1H, CHN), 3.66 (s, 3H, CH$_3$).

$^{13}$C-NMR (75 MHz, CDCl$_3$) $\delta$/ppm = 175.3 (C$_q$, CO$_2$Bn), 153.4 (C$_q$, C$_{Ar}$), 141.2 89 (C$_q$, C$_{Ar}$), 136.1 (C$_q$, C$_{Ar}$), 129.1 (+, CH, 2 × C$_{Ar}$), 128.8 (+, CH, C$_{Ar}$), 128.6 (+, CH, 2 × C$_{Ar}$), 115.7 (+, CH, 2 × C$_{Ar}$), 115.4 (+, CH, 2 × C$_{Ar}$), 67.2 (−, CH$_2$, CH$_2$Ph), 56.2 (+, CH$_3$, OCH$_3$), 53.8 (+, CH, CHN), 19.5 (+, CH$_3$).

The analytical data matches the data reported in the literature[25].

**Benzyl o-tolylalaninate (7g)**

GP was followed by adding benzyl 2-diazopropanoate (19.0 mg, 1.00 mmol, 1.00 equiv.) and o-toluidine (12.9 mg, 1.20 mmol, 1.20 equiv.) to a suspension of in situ generated Cu-(R$_5$S)4a catalyst. The product was obtained via column chromatography (c-Hex/EtOAc = 5:1) as colorless solid, 18.3 mg, 0.68 mmol, 68%.

$^1$H-NMR (300 MHz, CDCl$_3$) $\delta$/ppm = 7.44–7.27 (m, 5H, CH$_2$Ph), 7.15–7.05 (m, 2H, Ph), 6.72 (td, $J = 7.4$, 1.2 Hz, 1H, Ph), 6.55 (dd, $J = 8.4$, 1.2 Hz, 1H, Ph), 5.19 (s, 2H, CH$_2$Ph), 4.27 (q, $J = 6.9$ Hz, 1H, CHCH$_3$), 4.08 (s, 1H, NH), 2.21 (s, 3H, CH$_3$), 1.55 (d, $J = 6.9$ Hz, 3H, CHCH$_3$). $^{13}$C-NMR (75 MHz,
CDCl₃ δ/ppm = 174.7 (C₆, CO₂Bn), 144.7 (C₆, C₆H), 135.7 (C₆, C₆H), 130.5 (C₆, C₆H), 128.7 (+, CH, 2 × C₆H), 128.4 (+, CH, C₆H), 128.2 (+, CH, 2 × C₆H), 127.2 (+, CH, C₆H), 122.8 (+, CH, C₆H), 118.0 (+, CH, C₆H), 110.5 (+, CH, C₆H), 66.9 (−, CH₂, CH₂Ph), 52.1 (+, CH, CHN), 19.2 (+, CH₃), 17.5 (+, CH₃).

**Benzy1 p-tolyllalaninate (7h)**

GP was followed by adding benzyl 2-diazopropanoate (19.0 mg, 1.00 mmol, 1.00 equiv.) and p-toluclidine (12.9 mg, 0.12 mmol, 1.20 equiv.) to a suspension of in situ generated Cu-(R₆,S)-4a catalyst. The product was obtained via column chromatography (c-Hex/EtOAc = 4:1) as light-yellow solid, 18.8 mg, 0.70 mmol, 70%.

R⁴ = 0.31 (c-Hex/EtOAc = 5:1). ¹H-NMR (300 MHz, CDCl₃) δ/ppm = 7.34–7.14 (m, 5H, CH₂Ph), 6.89 (d, J = 8.1 Hz, 2H, 2 × C₆H), 6.45 (d, J = 8.4 Hz, 2H, 2 × C₆H), 5.06 (s, 2H, CH₂Ph), 4.09 (q, J = 7.0 Hz, 1H, CHN), 3.93 (s, 1H, NH), 2.16 (s, 3H, CH₃), 1.39 (d, J = 6.9 Hz, 3H, CHCH₃). ¹³C-NMR (75 MHz, CDCl₃) δ/ppm = 174.7 (C₆, CO₂Bn), 144.4 (C₆, C₆H), 135.7 (C₆, C₆H), 129.9 (C₆, C₆H), 128.6 (+, CH, 2 × C₆H), 128.4 (+, CH, C₆H), 127.8 (+, CH, C₆H), 113.9 (+, CH, C₆H), 66.8 (−, CH₂, CH₂Ph), 52.6 (+, CH, CHN), 20.5 (+, CH₃), 19.0 (+, CH₃).

**Phenyl phenylalaninate (7i)**

GP was followed by adding methyl 2-diao-2-phenylacetate (17.6 mg, 1.00 mmol, 1.00 equiv.) and aniline (11.2 mg, 0.12 mmol, 1.20 equiv.) to a suspension of in situ generated Cu-(R₆,S)-4a catalyst. The product was obtained via column chromatography (c-Hex/EtOAc = 5:1) as light-yellow liquid, 16.3 mg, 0.68 mmol, 68%.

¹H-NMR (300 MHz, CDCl₃) δ/ppm = 7.29 (td, J = 7.4, 6.8, 1.3 Hz, 2H, 2 × C₆H), 7.20–7.03 (m, 3H, 3 × C₆H), 6.98–6.87 (m, 2H, 2 × C₆H), 6.72 (tt, J = 7.3, 1.1 Hz, 1H, C₆H), 6.64 (dt, J = 7.7, 1.1 Hz, 2H, 2 × C₆H), 4.32 (q, J = 7.0 Hz, 1H, CHN), 4.12 (s, 1H, NH), 1.58 (d, J = 6.9 Hz, 3H, CHCH₃).

**tert-Butyl phenylalaninate (7j)**

GP was followed by adding tert-Butyl 2-diazopropanoate (15.6 mg, 0.10 mmol, 1.00 equiv.) and aniline (11.2 mg, 0.12 mmol, 1.20 equiv.) to a suspension of in situ generated Cu-(R₆,S)-4a catalyst. The product was obtained via flash chromatography (c-Hex/EtOAc = 8:1) as a light-yellow liquid, 16.4 mg, 0.74 mmol, 74%.

¹H-NMR (300 MHz, CDCl₃) δ/ppm = 7.21–7.11 (m, 3H, C₆H), 6.73 (t, J = 7.3 Hz, 1H, C₆H), 6.61 (d, J = 7.7 Hz, 2H, C₆H), 4.02 (q, J = 6.9 Hz, 1H, CHN), 1.44 (s, 9H, C(CH₃)₃), 1.43 (d, J = 6.9 Hz, 3H). ¹³C-NMR (75 MHz, CDCl₃) δ/ppm = 174.3 (C₆, CO₂Bu), 147.3 (C₆, C₆H), 129.8 (+, CH, 2 × C₆H), 118.6 (+, CH, C₆H), 114.0 (+, CH, 2 × C₆H), 82.0 (C₆, C(CH₃)₃), 53.1 (+, CH, CHNCH), 28.5 (+, CH₃, 3 × C₆H), 19.4 (+, CH₃, CHCH₃).

The analytical data matches the data reported in the literature [26].

**Methyl 2-phenyl-2-(phenylamino)acetate (14)**

GP was followed by adding phenyl-2-diazopropionate (17.6 mg, 0.10 mmol, 1.00 equiv.) and aniline (11.2 mg, 0.12 mmol, 1.20 equiv.) to a suspension of in situ generated Cu-(R₆,S)-4a catalyst. The product 7b was obtained via flash chromatography (c-Hex/EtOAc = 5:1) as colorless solid, 23.6 mg, 0.98 mmol, 98%.

¹H-NMR (300 MHz, CDCl₃) δ/ppm = 7.42 (d, J = 7.7 Hz, 2H, 2 × C₆H), 7.27 (qd, J = 7.5, 6.4, 2.6 Hz, 3H, 3 × C₆H), 7.04 (t, J = 7.9 Hz, 2H, 2 × C₆H), 6.62 (t, J = 7.5 Hz, 1H, C₆H), 6.48 (d, J = 7.7 Hz, 2H, 2 × C₆H), 5.01 (d, J = 5.9 Hz, 1H, CHN), 4.88 (s, 1H, NH), 3.65 (s, 3H, OCH₃).

The analytical data matches the data reported in the literature [23].

4. Conclusions

The successful N–H insertion of α-diazo carbonyls into anilines by copper catalysis with PCPBOX ligands have been demonstrated. In this work, we showed the synthesis and catalytic application of three different PCPBOX ligands. Their straight-forward synthesis renders them a very accessible...
The N–H insertion into saturated anilines was demonstrated to afford moderate to excellent yields with a wide substrate scope. The more sterically demanding PCPBOX ligands showed very good yields in the N–H insertion with unsaturated anilines.

**Supplementary Materials:** All NMR spectroscopic analysis and other characterization data are available online.

**Funding:** This research was funded by SBF/TRR88 3MET (B2).
