

FAIR DO Cookbook

Recipes for FAIR Digital Objects

Andreas Pfeil, Thomas Jejkal

Working in the realm of FAIR Digital Objects can be very abstract and sometimes overwhelming. There are so many aspects which have to be addressed in order to create a first FAIR Digital Object. The FAIR DO Cookbook aims to guide researchers and explain all required knowledge, ingredients and steps to execute. The target audience are people building, controlling or maintaining infrastructure or software that should work with FAIR DOs in some way, as well as people interested types, profiles and PIDs work and how they can be created.

The screenshot shows the 'FAIR DO Cookbook' website. The main heading is 'Create a PID'. Below it, there is a paragraph explaining that creating a PID involves registering an identifier and filling it with information. It also mentions that creating a PID is similar to 'creating a PID record' or 'minting a PID'. The text continues to discuss the need for a profile and how to search for or create one. Below this, there is an 'Ingredients' section with a bulleted list: 'A running Typed PID Maker (or FAIR DO Lab instance)', 'A PID Information Profile that can properly represent your object you want to represent', 'A reference to your data/object (e.g. a URL), which can be used with your profile', and 'Information which needs to be provided according to the profile'. At the bottom, there is a 'Work Steps (Summary)' section with two numbered steps: '1. Build a JSON-Representation of the PID record.' and '2. Send PID create request to Typed PID Maker.'

Future Work

- More conceptual content to widen the target audience
- Add wide range of practical use-cases
- Adjust with new developments in the field of FAIR DOs
