Forschungsgemeinschaft

Defect Phases: Motivation

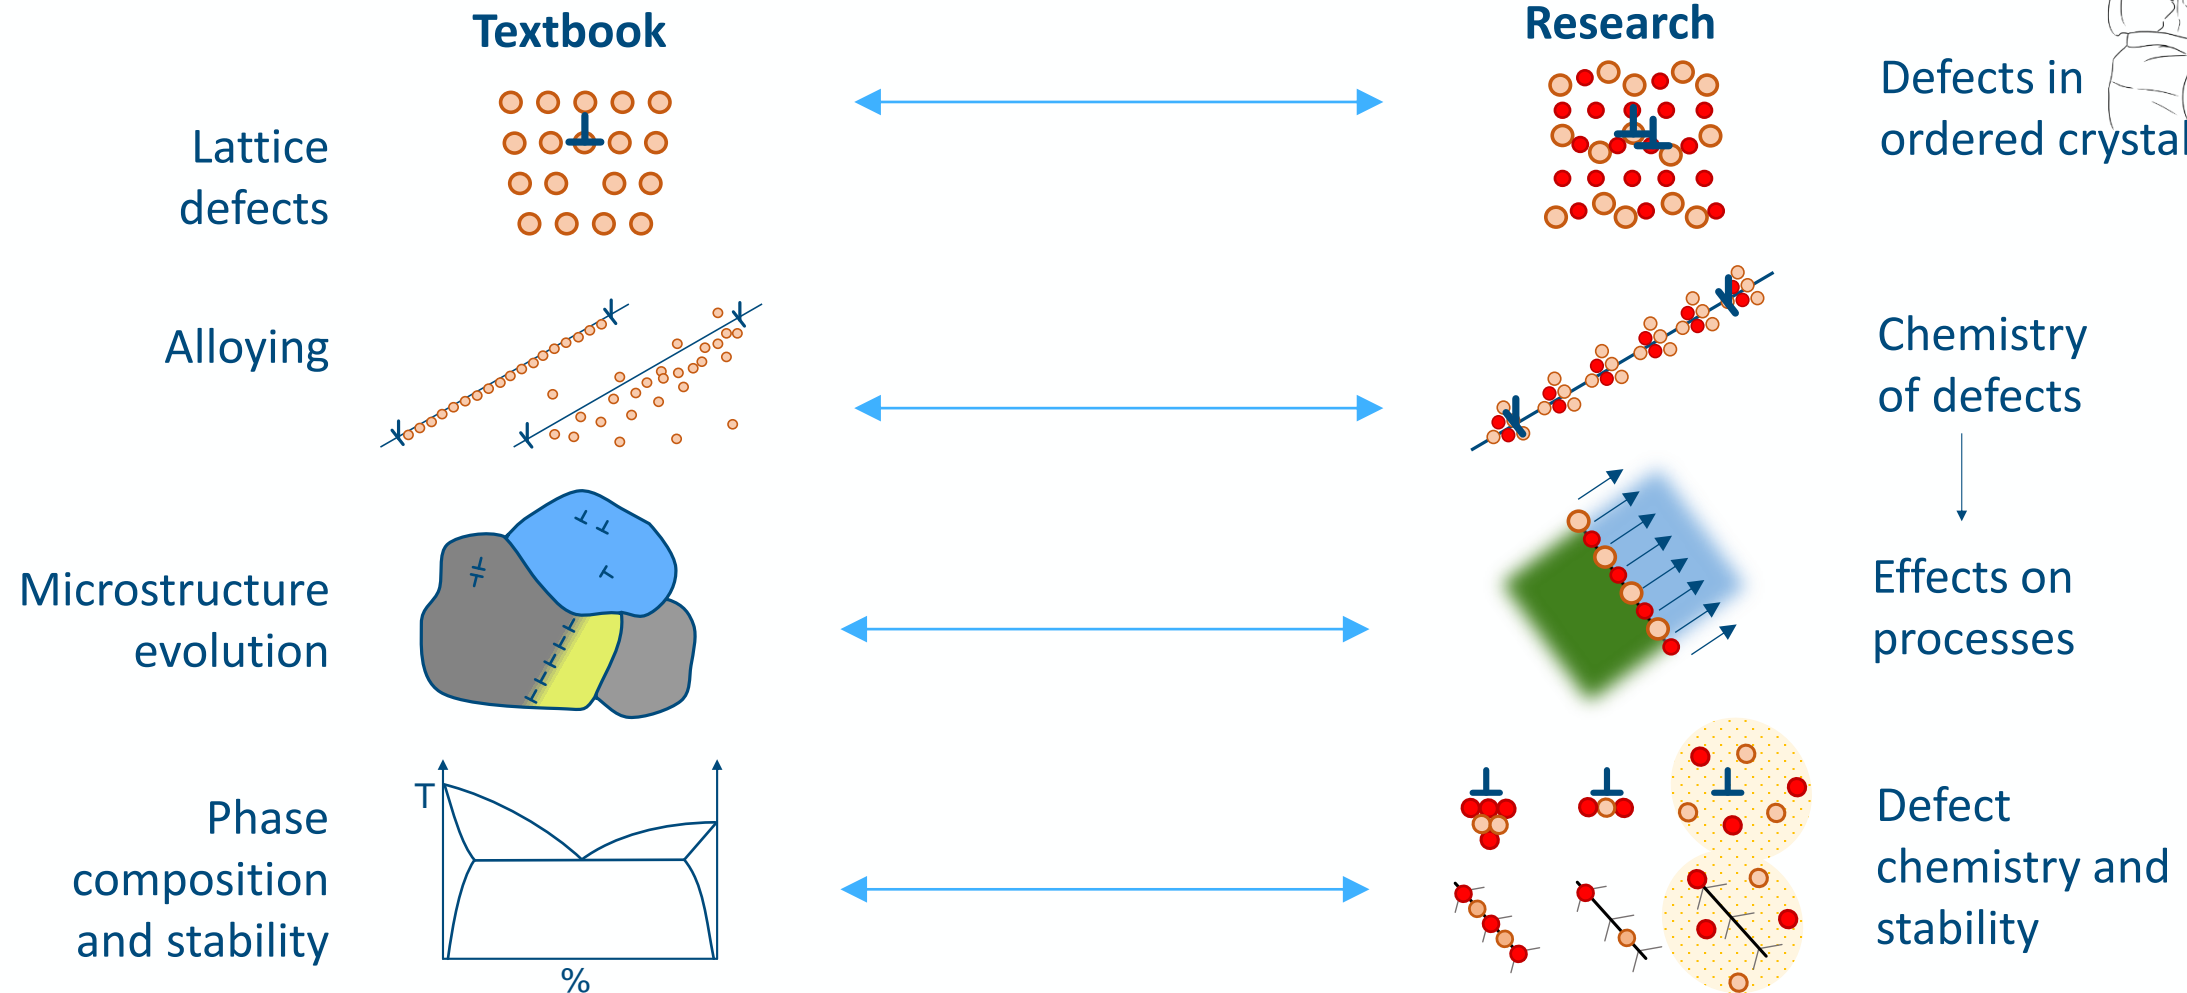

New materials

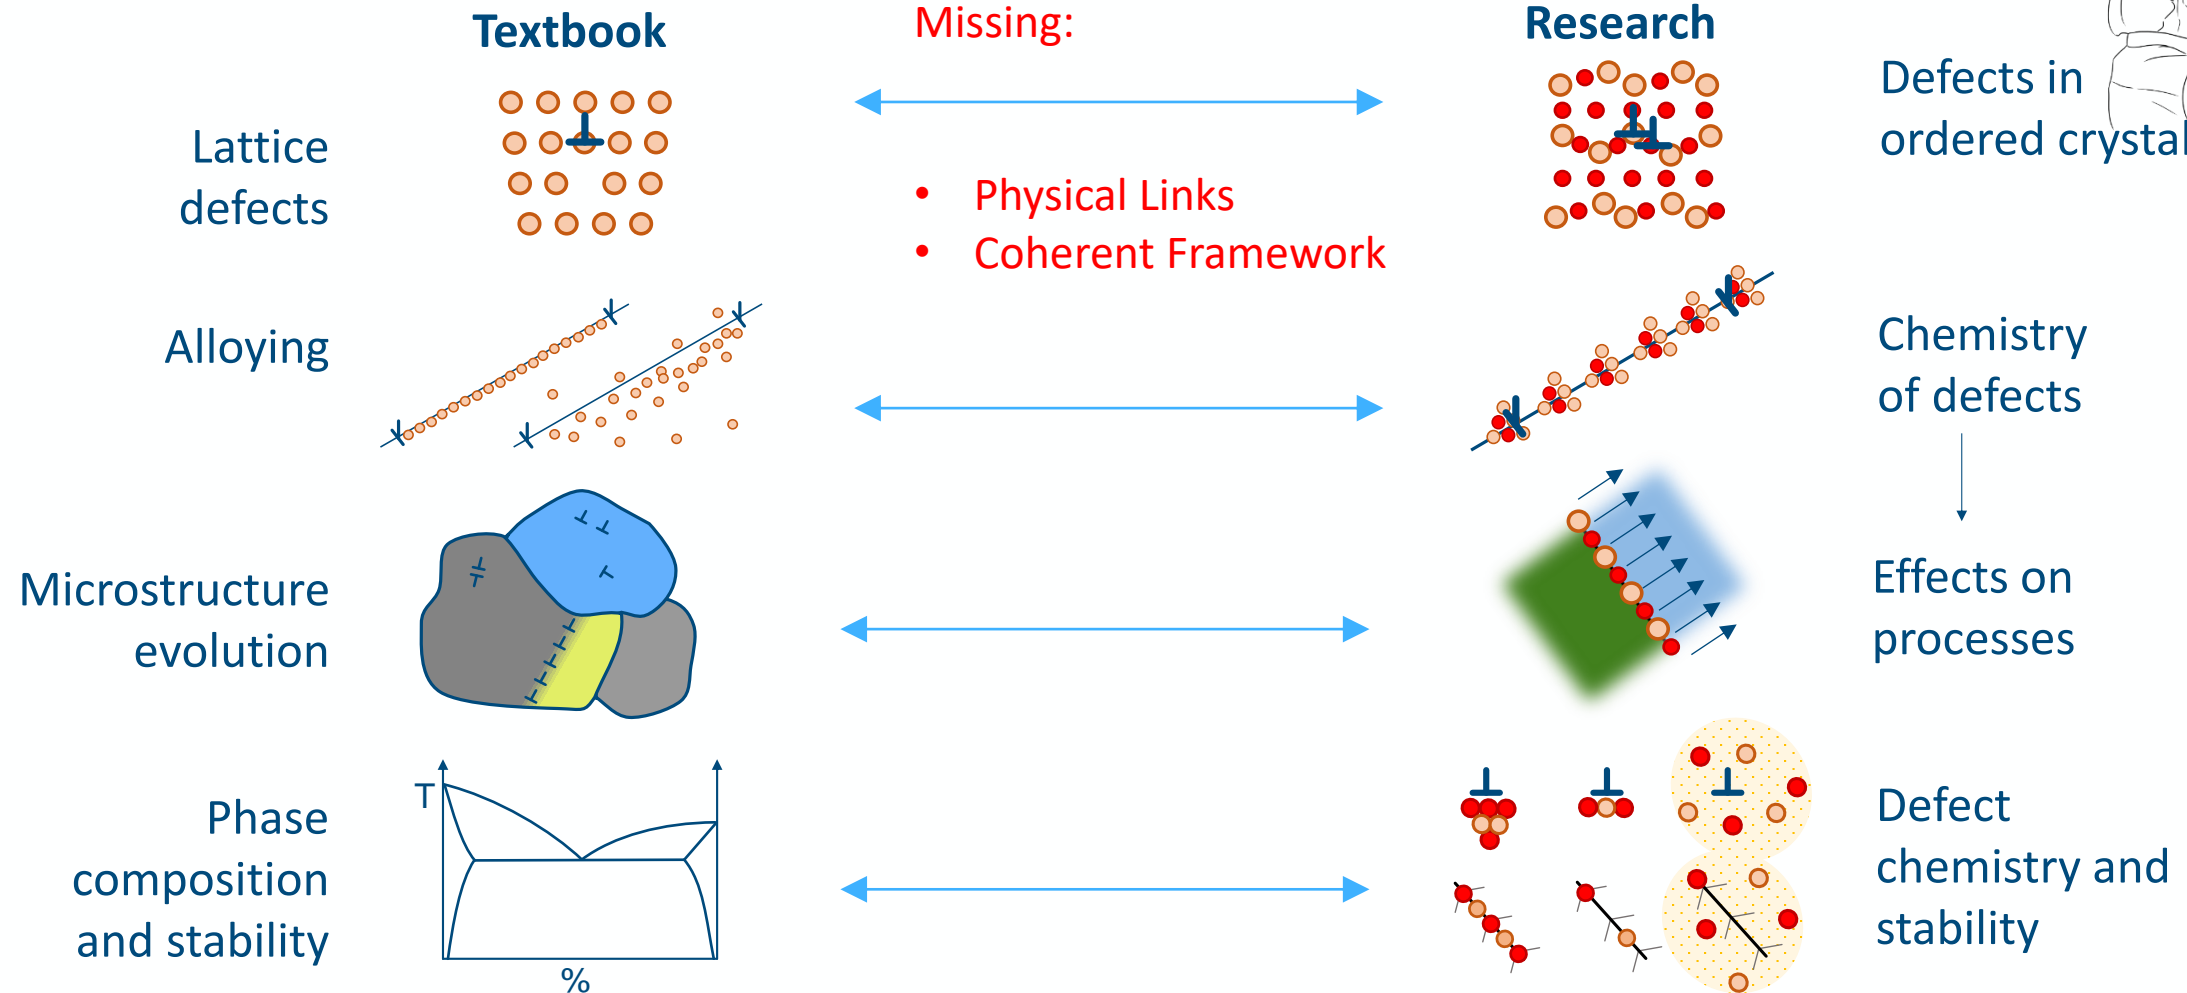

- ✓ Sustainable energy conversion
- ✓ Safe mobility
- ✓ Recycling potential
- ✓ Green manufacturing

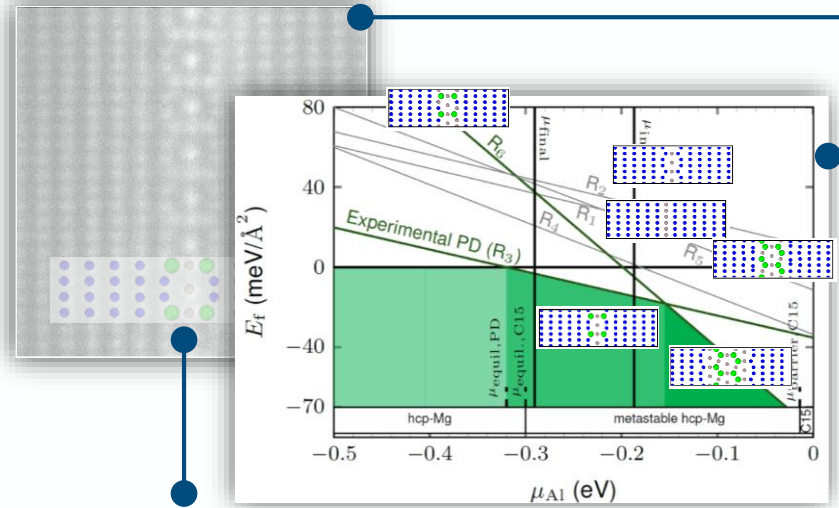

Defect Phases: Motivation

Defect Phases: Motivation

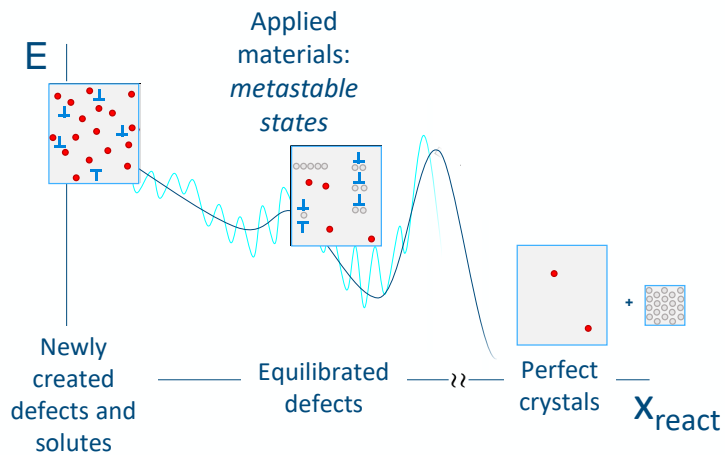

Defect phases and defect phase diagrams

What is their atomic scale structure?

How can we predict them?

How do they compete?

Korte-Kerzel et al. (2022) Int Materials Reviews 67(1), 89-117

24.09.2024

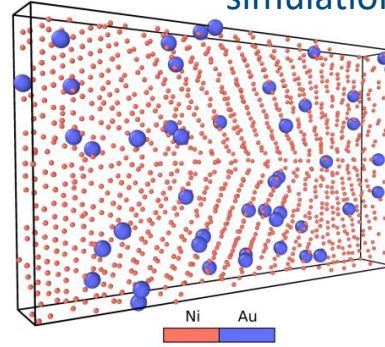

MSE 2024, Darmstadt, Germany

Challenge: Multidisciplinary Approach: SFB 1394

Large scale analysis & Machine Learning

Modelling & Atomistic simulations

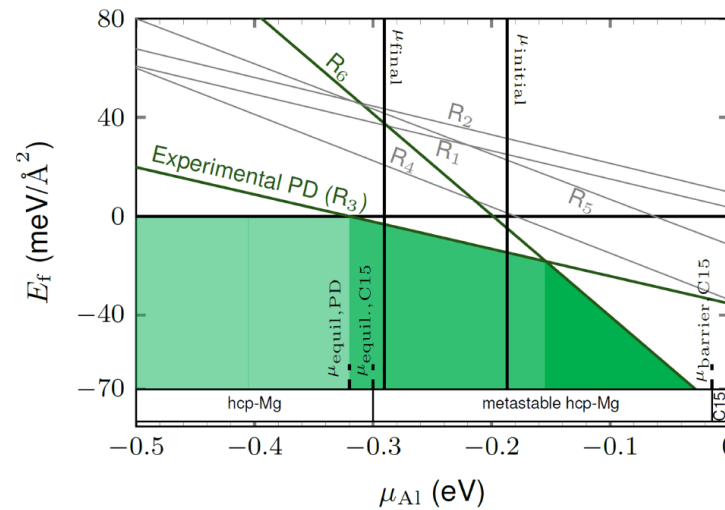

Corrosion analysis

Properties of defect phases

Atomic scale characterizations

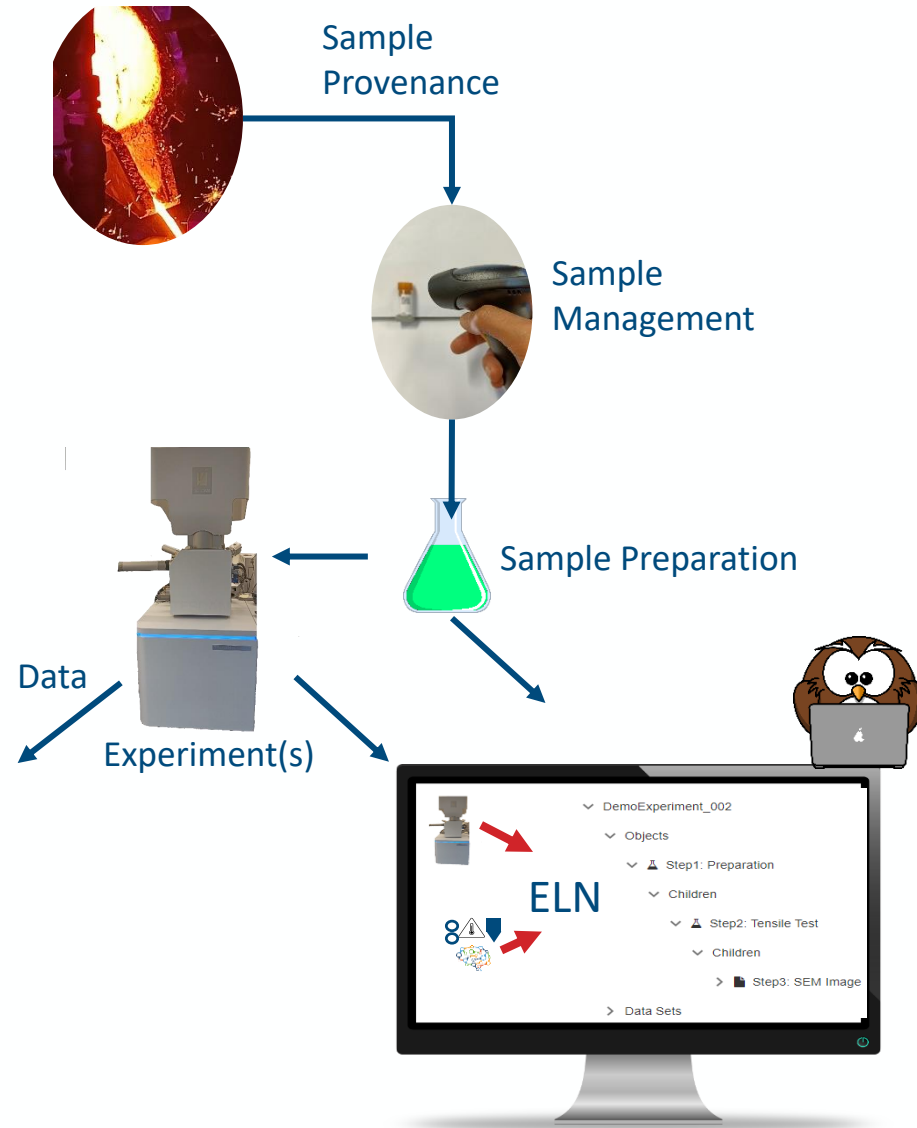

Microstructure and property analysis

A (simplified) experimental Workflow

Where do we need to be?

- Everything in one place
- Publish data (zenodo, etc)
- Easy onboarding / hand-over
- Track work across many years
- Build a data repository → Machine Learning & AI

What do we need to track (experiment)?

Experimental Samples:

- The samples themselves (physically)
→ sample management
- How they are created
- Preparation, mechanical tests,
- ...

Scientific Instruments

- Make & Model & Version
- Software version
- Settings during experiment
- ...

“Big Data”:

- Integration with ELN
- Accessible from everywhere
(Desktop, cluster, conference,
research/field trip, ...)

Code

- Control code
- Analysis code
- Software environment & libraries
- Virtual Machine / Container?

Experimental Data

- Raw data
- Processed & analysed data
- Automatic metadata extraction

Description of Experiments, Results, ...

- Description of experiments
- Annotations / comments
- Link to samples, devices, data, methods

→ Electronic Lab Notebooks (ELN)

Chemicals & Consumables:

- What is used in sample preparation?

Standard Operating Procedures / Protocols

- How are experiments done?
- How are samples prepared?
- How are instruments operated & settings?

API / Python Access

- Interact with analysis code
- Batch processing
- Search / filter / retrieve
data & results

Tracking Samples & Measurements

(Modern) Instruments store many details about measurements:

- Settings
- Conditions
- Results

→ extract (meta-) data automatically & store in RDM

Challenge: Detailed Metadata Schema

- Samples
- Instruments
- Methods & Procedures
- Consumables, Preparation material, ...
- Data - Measurements & Results
- Simulation

Available Solution Space

Requirements

- Relational data model
 - Defined metadata schema
 - Hierarchical (parent/child) relations
 - Controlled vocabulary
 - Complex queries
- Electronic lab notebook
 - Integrated in relational model
 - Standard operating procedures (SOP)
 - Inventory of samples, devices, SOP → included in workflow
 - Additionally: free-text comments, images, ...
- Big Data storage
- Automated data ingestion + metadata from exp. devices
- Share data (within collaboration, publicly)
- Convenient access for analysis (e.g. integrated, "hooks", ...)
- Sample management

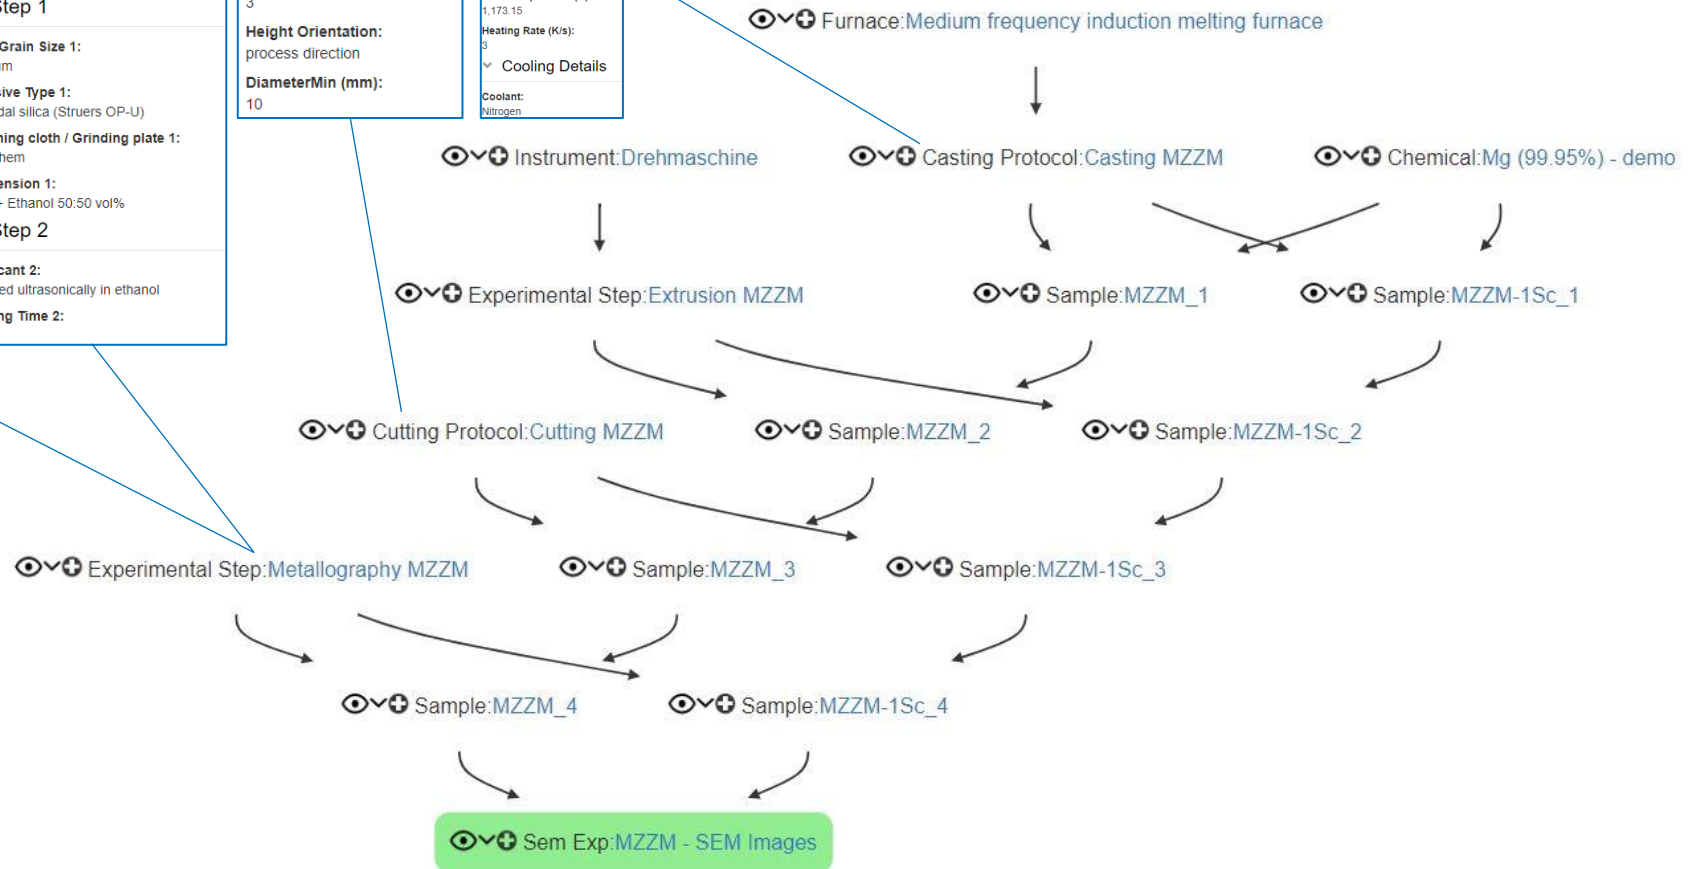

Example: Sample from Casting to SEM Imaging

- Sfb1394 Demo
 - Metallography Protocols
 - Samples_MgZnZrMg
- Sample Preparation
 - Objects
 - Casting MZZM
 - Extrusion MZZM
 - Cutting MZZM
 - Metallography MZZM
- Sample Characterization
 - Objects
 - MZZM - EBSD + EDX
 - MZZM - SEM Images

➔

Combined result
Simulation + Experiment

Key Take-Aways

Building an interoperable infrastructure for simulation & experimental data.

- “Just” an electronic lab notebook (ELN) is not enough: track samples & provenance, methods, instruments, ...
→ ELN + Laboratory Information System (LIMS): openBIS
- A lot of (meta-) data can be captured, but:
 - Large variety of scientific instruments & methods
 - Each instruments comes with their own open/closed data format
→ many parsers need to be written & adapted to extract data & metadata and transform to open data formats for analysis and data publication
- Development of extensive metadata schema for data, instruments, methods, ...
- Development of tailored tools for connecting instruments to RDM
→ prerequisite to building workflows.
- Combine simulation & experimental data → Defect Phase Diagrams

Data sheet for IUC04: Model driven data space exploration

SFB
1394

24.09.2024

Main TA	TA-WSD
Related TA	TA-OMS
PPs	<ul style="list-style-type: none"> • 02 / Defect phases in structural materials (CRC 1394) • 05 / HoMMage – Hysteresis design of magnetic materials for efficient energy conversion (CRC/TRR 270)
Material/Data	Mg-Al-Ca alloys / Thermodynamic and structural data of defects
Success Scenario	User can automatically generate defect phase diagrams that can be used to predict the performance of materials
Added value	General framework of model-driven thermodynamic databases that combine computation and experiment
Requirements	<ul style="list-style-type: none"> • Workflows combining theoretical and exp. structural data of defects • Adaptive databases for high dim. data structures containing sparse data • Visualization (of thermodin. dataspace from microstructure, chemical or mechanical perspective) • Multiscale simulation (of multiphysics data) • Electronic lab book (for defect data)

Structural and Chemical Atomic Complexity

- From Defect Phase Diagrams to Material Properties

Main Success Scenario:

- User can automatically generate defect phase diagrams
- that can be used to predict the performance of materials

Topics

- defect phase diagrams are novel → only a limited amount of thermo-chemo-structural data is available.
- attributed to certain defect types, characters and states.
- model-driven (guided probing) collection of the relevant experimental and computational data
- post-processing with newly established simulation protocols.
- multidisciplinary perspective (i.e., atomic configurations, chemical potentials, and of materials properties).

Main requirements

- Workflows combining theoretical and experimental structural data of defects
- Adaptive databases for high dimensional data structures containing sparse data
- Visualization (of thermodynamic dataspace from microstructure, chemical or mechanical perspective)
- Multiscale simulation (of multiphysics data)
- Electronic lab book (for defect data)

Goal demonstrator: Provide an environment that allows one to combine experimental data from electronmicroscopy and atomistic simulations for defect phase diagrams

Main steps:

- Ample number of planar defects observed in Ca and Al rich Mg samples
- HAADF-TEM images yield data on chemical & structural configurations

Central storage solution required

- Various raw data formats
- HDF5 files of simulations
- S3 storage system (CoSciene)
- Electronic Lab Notebook (OpenBIS) & experimental data/metadata management

- Atomic coordinates for structural models of grain boundaries
- Segregation energy profiles for Al and Ca solutes

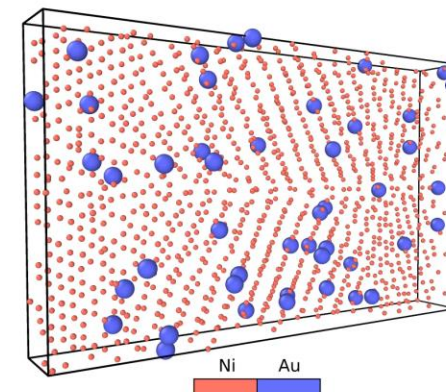

- Defect formation energies for variety of chemical & structural configurations
- Dependence on chemical potential
- Defect phase diagrams

Large scale analysis

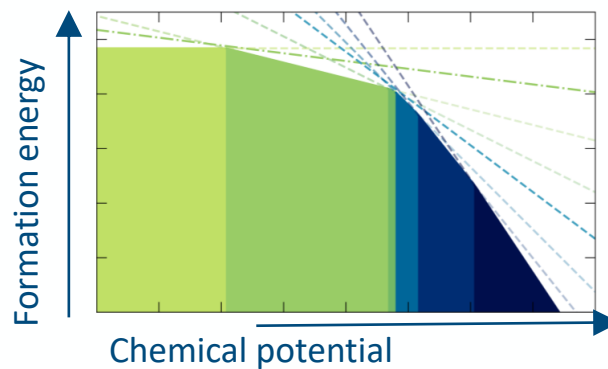

Atomic scale characterizations

Modelling & Atomistic simulations

Corrosion analysis

Chemical potential

Microstructure and property analysis

Experimental

- Over 150 image file formats supported, including all major microscope formats
- Extracts automatically metadata, additional metadata can be provided, metadata templates
- View, annotate (Image details, key-value pairs, annotated ROIs, can be searched and exported), organize, analyze & share data
- Possibility for scripting (e.g. analyzing, publishing),
- API
- Integration in ecosystem with OpenBis demonstrated

The top screenshot shows the OMERO interface with the following panels:

- Tags:** 3 tags: Mg-Ca-Al, IPB, C15.
- Key-Value Pairs:** 1 pair: Sample ID: 10.

The bottom screenshot shows an image with a yellow ROI. The ROI information panel displays:

- ROI Name: sym Sigma 5 tilt GB
- Coordinates: X: 140.3, Y: 33.7, Width: 37.3, Height: 274.2
- Area: 10231.138 px²

The ROI list at the bottom shows:

Show	Z	T	C	Comment
<input checked="" type="checkbox"/>	<input type="checkbox"/>	1	1	sym Sigma 5 tilt GB

- Two sigma 7 grain boundaries (GBs) in hcp Mg:
 - $\Sigma=7$ [0001] | 38.2° Sym. plane (-1 5 -4 0)
 - $\Sigma=7$ [0001] | 21.78° Sym. Plane (1 2 -3 0)
- Two types of sigma 7 21.78° GBs:

$$\gamma_{GB} = \frac{E_{GB} - E_{bulk}}{2A_{GB}}$$

T – type

GB Energy = 308.6 mJ/m²

Excess Vol. = 0.22271 Å

A – type

GB Energy = 311.2 mJ/m²

Excess Vol. = 0.27256 Å

T - type

$$E_{\text{seg}} = [E(\text{Mg}_{N-1}\text{Y}) - E(\text{Mg}_N)]_{\text{GB}} - [E(\text{Mg}_{M-1}\text{Y}) - E(\text{Mg}_M)]_{\text{bulk}}$$

- Ga and Al show similar segregation behavior
- Ca shows different segregation preference
- Mg, Al stabilize A-type; most stable site *a1*
- Mg-Al MEAM potential, segregation behavior of Al similar to Ga DFT

Y.-M. Kim, N.J. Kim, and B.-J. Lee (2009), "Atomistic Modeling of pure Mg and Mg-Al systems", *Calphad*, **33**(4), 650-657. DOI: [10.1016/j.calphad.2009.07.004](https://doi.org/10.1016/j.calphad.2009.07.004).

$$E_{\text{seg}} = \frac{[E(\text{Mg}_{N-1}\text{Y}) - E(\text{Mg}_N)]_{\text{GB}} - [E(\text{Mg}_{M-1}\text{Y}) - E(\text{Mg}_M)]_{\text{bulk}}}{N - M}$$

- Ga and Al, smaller than Mg, show similar segregation behavior
- Ca - larger atom compared to Mg, Al; shows different segregation preference
- Ca stabilizes T-type; most stable site a3

File Edit View Run Kernel Diagram Tabs Settings Help

How to upload our pyiron jobs to coscine?

To upload pyiron jobs to coscine, you need to have

- the most recent version of pyiron_contrib
- the coscine package installed
- a coscine account to upload to
- a coscine token!

The first two are normal python updates/installs (e.g. using `mamba install -c conda-forge coscine` or the like). For the second one, you log in into coscine and open the [user profile](#). Below the 'Personal Information' you will find the 'Access Token' section in which you choose a name for your token and an expiration date and create a token. Copy and store the token in a save place (e.g. a password manager)! It provides **full access** to all data available to you on coscine!

```
[1]: from pyiron import Project
```

```
[6]: pr = Project('SFB')
```

Access storage

After the storage has been setup, you may access the storage of the storage interface. It lists all storage locations known to it, their type and if they are connected or not:

```
[36]: pr.storage_interface.storage
```

```
[36]: Storage Access for ['Mg(coscine, inactive)'].
```

If you access a storage which is not connected, the connection will be established and you may be asked for the credentials.

```
[37]: a_resource = pr.storage_interface.storage['Mg']
```

Through the storage, you can access all data inside this folder:

```
[38]: a_resource
```

```
[38]: {'groups': [], 'nodes': []}
```

Upload a job

A job, which is uploaded to a 'sfb1394/AtomisticSimulation' folder should be parsed for metadata automatically. Thus for a job it should be sufficient to run:

```
[40]: job = pr['Mg_450K'] # Load the job using pyiron
```

```
[41]: a_resource.upload_job(job)
```

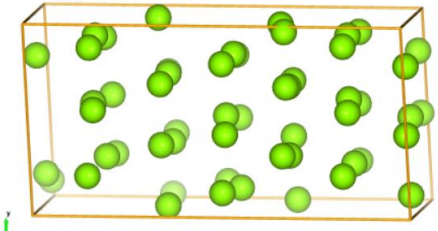

Mg_450K.h5: 100% ██████████ 1.10M/1.10M [08:59<00:00, 7.98MB/s]

Access a job

```
[43]: job_reload = a_resource.load_job(project=pr, name='Mg_450K')
```

Mg_450K.h5: 100% ██████████ 1.10M/1.10M [00:00<00:00, 20.2MB/s]

```
[44]: job_reload.get_structure().plot3d()
```
