[3] Recalculated by ANDREOTTI 05A, using the value of $\psi(2S)$ mass from AULCHENKO 03.
[4] Using mass of $\psi(2S) = 3686.0$ MeV.
[5] $J/\psi(1S)$ mass constrained to 3097 MeV.
[6] Mass value shifted by us by amount appropriate for $\psi(2S)$ mass = 3686 MeV and $J/\psi(1S)$ mass = 3097 MeV.
[7] From a simultaneous fit to radiative and hadronic decay channels.

CONSTRAINED FIT INFORMATION

A multiparticle fit to $\chi_{c1}(1P)$, $\chi_{c0}(1P)$, $\chi_{c2}(1P)$, and $\psi(2S)$ with 4 total widths, a partial width, 27 combinations of partial widths obtained from integrated cross section, and 87 branching ratios uses 263 measurements to determine 50 parameters. The overall fit has a $\chi^2 = 435.4$ for 213 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\left\langle \delta p_i \delta p_j \right\rangle / (\delta p_i \cdot \delta p_j)$, in percent, from the fit to parameters p_i, including the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{\rm total}$.

FIT INFORMATION

A multiparticle fit to $\eta_c(1S)$, $J/\psi(1S)$, $\psi(2S)$, $h_c(1P)$, and $B^\pm$ with the total width, 10 combinations of partial widths obtained from integrated cross section, and 38 branching ratios uses 115 measurements to determine 19 parameters. The overall fit has a $\chi^2 = 215.4$ for 96 degrees of freedom.

[5] DOBBS 08A reports $[\Gamma(h_c(1P) \to \gamma\eta_c(1S))/\Gamma_{total}] \times [B(\psi(2S) \to h_c(1P)\pi^0)] = (4.19 \pm 0.32 \pm 0.45) \times 10^{-4}$ which we divide by our best (shown rounded) value $B(\psi(2S) \to h_c(1P)\pi^0) = (7.4 \pm 0.5) \times 10^{-4}$. Our first error is their experiment's error and our second error is the systematic error from using our best (shown rounded) value.

[6] ROSNER 05 reports $[\Gamma(h_c(1P) \to \gamma\eta_c(1S))/\Gamma_{total}] \times [B(\psi(2S) \to h_c(1P)\pi^0)] = (4.0 \pm 0.8 \pm 0.7) \times 10^{-4}$ which we divide by our best (shown rounded) value $B(\psi(2S) \to h_c(1P)\pi^0) = (7.4 \pm 0.5) \times 10^{-4}$. Our first error is their experiment's error and our second error is the systematic error from using our best (shown rounded) value.

[1] From a fit of the $\phi\phi$ invariant mass with the width of $\chi_{c2}(1P)$ fixed to the PDG 16 value.

[2] AAIJ 17BI reports also $m(\chi_{c2}) - m(\chi_{c1}) = 45.39 \pm 0.07 \pm 0.03$ MeV.

[3] Recalculated by ANDREOTTI 05A, using the value of $\psi(2S)$ mass from AULCHENKO 03.

[4] Using mass of $\psi(2S) = 3686.0$ MeV.

[5] $J/\psi(1S)$ mass constrained to 3097 MeV.

[6] Assuming $\psi(2S)$ mass = 3686 MeV and $J/\psi(1S)$ mass = 3097 MeV.

[7] Mass value shifted by us by amount appropriate for $\psi(2S)$ mass = 3686 MeV and $J/\psi(1S)$ mass = 3097 MeV.

[8] From a simultaneous fit to radiative and hadronic decay channels.

CONSTRAINED FIT INFORMATION

A multiparticle fit to $\chi_{c1}(1P)$, $\chi_{c0}(1P)$, $\chi_{c2}(1P)$, and $\psi(2S)$ with 4 total widths, a partial width, 27 combinations of partial widths obtained from integrated cross section, and 87 branching ratios uses 263 measurements to determine 50 parameters. The overall fit has a $\chi^2 = 435.4$ for 213 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta p_i \delta p_j \rangle / (\delta p_i \cdot \delta p_j)$, in percent, from the fit to parameters p_i, including the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{\rm total}$.

[1] From a fit to the J/ψ recoil mass spectra.
[2] The value for $B(\psi(2S) \to \gamma\chi_{c2}) \times B(\chi_{c2} \to \gamma J/\psi(1S))$ reported in HIMEL 80 is derived using $B(\psi(2S) \to J/\psi(1S)\pi^+\pi^-) = (33 \pm 3)\%$ and $B(J/\psi(1S) \to \ell^+\ell^-) = 0.138 \pm 0.018$. Calculated by us using $B(J/\psi(1S) \to \ell^+\ell^-) = (0.1181 \pm 0.0020)$.
[3] Not independent from other values reported by ADAM 05A.

$\Gamma(\chi_{c2}(1P) \to \gamma\gamma)/\Gamma_{\text{total}} \times \Gamma(\psi(2S) \to \gamma\chi_{c2}(1P))/\Gamma_{\text{total}}$ $\Gamma_{111}/\Gamma \times \Gamma_{198}^{\psi(2S)}/\Gamma^{\psi(2S)}$

[1] AAIJ 17AD report $m_{\psi(2S)} - m_{\eta_c(2S)} = 52.5 \pm 1.7 \pm 0.6$ MeV. We use the current value $m_{\psi(2S)} = 3686.097 \pm 0.025$ MeV to obtain the quoted mass.
[2] From a fit of the $\phi\phi$ invariant mass with the width of $\eta_c(2S)$ fixed to the PDG 16 value.
[3] Ignoring possible interference with continuum.
[4] With a width fixed to 11.3 MeV.
[5] With a width fixed to 11.3 MeV. Using both $\eta \to \gamma\gamma$ and $\eta \to \pi^+\pi^-\pi^0$ decays.
[6] From a simultaneous fit to $K^0_S K^\pm\pi^\mp$ and $K^+K^-\pi^0$ decay modes.
[7] Accounts for interference with non-resonant continuum.
[8] From a fit of the J/ψ recoil mass spectrum. Supersedes ABE,K 02 and ABE 04G.
[9] From the fit of the kaon momentum spectrum. Systematic errors not evaluated.
[10] Superseded by DEL-AMO-SANCHEZ 11M.
[11] Superseded by VINOKUROVA 11.
[12] Assuming mass of $\psi(2S) = 3686$ MeV.

FIT INFORMATION

A multiparticle fit to $\eta_c(2S)$ and $\psi(2S)$ with 4 branching ratios uses 5 measurements to determine 3 parameters. The overall fit has a $\chi^2 = 2.6$ for 2 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \cdot \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{\rm total}$.

$1.3\ \pm0.6$		[2] ASNER	04	CLEO	$\gamma\gamma \to \eta_c' \to K^0_S K^\pm\pi^\mp$

[1] Assuming that the branching fraction into $\eta'\pi^+\pi^-$ is the same as for $\eta_c(1S)$.
[2] They measure $\Gamma(\eta_c(2S)\gamma\gamma)\,B(\eta_c(2S) \to K\overline{K}\pi) = (0.18 \pm 0.05 \pm 0.02)\,\Gamma(\eta_c(1S)\gamma\gamma)\,B(\eta_c(1S) \to K\overline{K}\pi)$. The value for $\Gamma(\eta_c(2S) \to \gamma\gamma)$ is derived assuming that the branching fractions for $\eta_c(2S)$ and $\eta_c(1S)$ decays to $K_S K\pi$ are equal and using $\Gamma(\eta_c(1S) \to \gamma\gamma) = 7.4 \pm 0.4 \pm 2.3$ keV.

$\psi(2S)$

$I^G(J^{PC}) = 0^-(1^{--})$

See the Review on "Branching Ratios of $\psi(2S)$, $\chi_{c0,1,2}$ and $\eta_c(1S)$" before the $\chi_{c0}(1P)$ Listings.

$\psi(2S)$ MASS

OUR FIT includes measurements of $m_{\psi(2S)}$, $m_{\psi(3770)}$, and $m_{\psi(3770)} - m_{\psi(2S)}$.

VALUE (MeV)	EVTS	DOCUMENT ID		TECN	COMMENT
3686.097±0.011 OUR FIT Error includes scale factor of 1.1.					
3686.097±0.010 OUR AVERAGE					
3686.099±0.004±0.009		[1] ANASHIN	15	KEDR	$e^+e^- \to$ hadrons

3685.95 ±0.10	413	[2] ARTAMONOV	00	OLYA	$e^+e^- \to$ hadrons
3685.98 ±0.09 ±0.04		[3] ARMSTRONG	93B	E760	$\overline{p}p \to e^+e^-$
• • • We do not use the following data for averages, fits, limits, etc. • • •					
3686.08 ±0.07	1301	[4] AAIJ	23AP	LHCB	$B^0_s \to J/\psi 2(\pi^+\pi^-)$
3686.114±0.007 $^{+0.011}_{-0.016}$		[5] ANASHIN	12	KEDR	$e^+e^- \to$ hadrons
3686.111±0.025±0.009		AULCHENKO	03	KEDR	$e^+e^- \to$ hadrons
3686.00 ±0.10	413	[6] ZHOLENTZ	80	OLYA	e^+e^-

[1] Supersedes AULCHENKO 03 and ANASHIN 12.

[2] Reanalysis of ZHOLENTZ 80 using new electron mass (COHEN 87) and radiative corrections (KURAEV 85).

[3] Mass central value and systematic error recalculated by us according to Eq. (16) in ARMSTRONG 93B, using the value for the $J/\psi(1S)$ mass from AULCHENKO 03.

[4] From a fit of a relativistic S-wave Breit-Wigner convolved with the detector resolution. The width of $\psi(2S)$ is constrained to the PDG 22 value. Systematic errors not evaluated.

[5] From the scans in 2004 and 2006. ANASHIN 12 reports the value 3686.114 ± 0.007 ± $0.011^{+0.002}_{-0.012}$ MeV, where the third uncertainty is due to assumptions on the interference between the resonance and hadronic continuum. We combined the two systematic uncertainties.

[6] Superseded by ARTAMONOV 00.

$m_{\psi(2S)} - m_{J/\psi(1S)}$

[a] $\Theta(1540)$ is a hypothetical pentaquark state of 1.54 GeV/c^2 mass and a width of less than 25 MeV/c^2.

[b] For a narrow resonance in the range $2.2 < M(X) < 2.8$ GeV.

Meson Particle Listings

$\psi(2S)$

CONSTRAINED FIT INFORMATION

A multiparticle fit to $\chi_{c1}(1P)$, $\chi_{c0}(1P)$, $\chi_{c2}(1P)$, and $\psi(2S)$ with 4 total widths, a partial width, 27 combinations of partial widths obtained from integrated cross section, and 87 branching ratios uses 263 measurements to determine 50 parameters. The overall fit has a $\chi^2 = 435.4$ for 213 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta p_i \delta p_j \rangle / (\delta p_i \cdot \delta p_j)$, in percent, from the fit to parameters p_i, including the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\rm total}$.

FIT INFORMATION

A multiparticle fit to $\eta_c(2S)$ and $\psi(2S)$ with 4 branching ratios uses 5 measurements to determine 3 parameters. The overall fit has a $\chi^2 = 2.6$ for 2 degrees of freedom.

FIT INFORMATION

A multiparticle fit to $\eta_c(1S)$, $J/\psi(1S)$, $\psi(2S)$, $h_c(1P)$, and $B^\pm$ with the total width, 10 combinations of partial widths obtained from integrated cross section, and 38 branching ratios uses 115 measurements to determine 19 parameters. The overall fit has a $\chi^2 = 215.4$ for 96 degrees of freedom.

[1] ABLIKIM 15V reports 2.213 ± 0.018 ± 0.099 keV from a measurement of $[\Gamma(\psi(2S) \to e^+e^-)] \times [B(\psi(2S) \to J/\psi(1S)\pi^+\pi^-)]$ assuming $B(\psi(2S) \to J/\psi(1S)\pi^+\pi^-) = (34.95 \pm 0.45) \times 10^{-2}$, which we rescale to our best (shown rounded) value $B(\psi(2S) \to J/\psi(1S)\pi^+\pi^-) = (34.78 \pm 0.33) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best (shown rounded) value.

[2] From a simultaneous fit to e^+e^-, $\mu^+\mu^-$, and hadronic channel, assuming $\Gamma_e = \Gamma_\mu = \Gamma_\tau/0.38847$.

[3] Combining $\Gamma_{e^+e^-} \cdot B(\mu^+\mu^-)$ from ANASHIN 18 with $\Gamma_{e^+e^-} \cdot$ B(hadrons) from ANASHIN 12 and assuming lepton universality.

[4] From the sum of $\Gamma_{e^+e^-} \cdot$B(hadrons) from ANASHIN 12, $\Gamma_{e^+e^-} \cdot B(e^+e^-)$ and $\Gamma_{e^+e^-} \cdot B(\mu^+\mu^-)$ from ANASHIN 18, and $\Gamma_{e^+e^-} \cdot B(\tau^+\tau^-)$ from ANASHIN 07.

[5] From a simultaneous fit to e^+e^-, $\mu^+\mu^-$, and hadronic channels assuming $\Gamma(e^+e^-) = \Gamma(\mu^+\mu^-)$.

$\psi(2S)$ Γ(i)$\Gamma(e^+e^-)/\Gamma$(total)

This combination of a partial width with the partial width into e^+e^- and with the total width is obtained from the integrated cross section into channel(i) in the e^+e^- annihilation. We list only data that have not been used to determine the partial width Γ(i) or the branching ratio Γ(i)/total.

Int. J. Mod. Phys. A 2026.41. Downloaded from www.worldscientific.com by KARLSRUHE INSTITUTE OF TECHNOLOGY on 10/26/26. Re-use and distribution is strictly not permitted, except for Open Access articles.

[3] The value of $\Gamma(e^+e^-)$ quoted in BAI 98E is derived using $B(\psi(2S) \to J/\psi(1S)\pi^+\pi^-) = (32.4 \pm 2.6) \times 10^{-2}$ and $B(J/\psi(1S) \to \ell^+\ell^-) = 0.1203 \pm 0.0038$. Recalculated by us using $B(J/\psi(1S) \to \ell^+\ell^-) = 0.1181 \pm 0.0020$.

[4] AUBERT 07AU reports $[\Gamma(\psi(2S) \to J/\psi(1S)\pi^+\pi^-) \times \Gamma(\psi(2S) \to e^+e^-)/\Gamma_{total}] \times [B(J/\psi(1S) \to \pi^+\pi^-\pi^0)] = 0.0186 \pm 0.0012 \pm 0.0011$ keV which we divide by our best (shown rounded) value $B(J/\psi(1S) \to \pi^+\pi^-\pi^0) = (2.00 \pm 0.07) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best (shown rounded) value.

[5] AUBERT 05D reports $[\Gamma(\psi(2S) \to J/\psi(1S)\pi^+\pi^-) \times \Gamma(\psi(2S) \to e^+e^-)/\Gamma_{total}] \times [B(J/\psi(1S) \to \mu^+\mu^-)] = 0.0450 \pm 0.0018 \pm 0.0022$ keV which we divide by our best (shown rounded) value $B(J/\psi(1S) \to \mu^+\mu^-) = (5.961 \pm 0.033) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best (shown rounded) value. Superseded by LEES 12E.

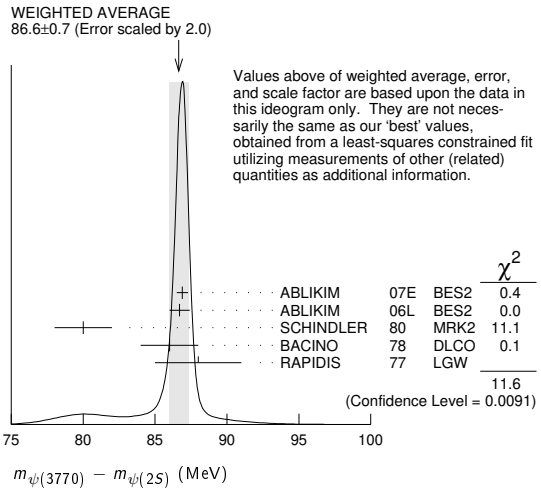
3778.4±3.0±1.3	34	CHISTOV	04	BELL	Sup. by BRODZICKA 08



[1] Measured in prompt hadroproduction.
[2] Taking into account interference between the resonant and non-resonant $D\overline{D}$ production.
[3] Real part of pole location extracted using K-matrix formalism that includes two resonance poles, $\psi(2S)$ and $\psi(3770)$.
[4] From the joint analysis of the data on the $D\overline{D}$ and inclusive hadronic cross sections in the $\psi(3770)$ region from BaBar, Belle, BES-II, CLEO and KEDR.
[5] Reanalysis of data presented in BAI 02C. From a global fit over the center-of-mass energy region 3.7–5.0 GeV covering the $\psi(3770)$, $\psi(4040)$, $\psi(4160)$, and $\psi(4415)$ resonances. Phase angle fixed in the fit to $\delta = 0^\circ$.
[6] Interference between the resonant and non-resonant $D\overline{D}$ production not taken into account.

$m_{\psi(3770)} - m_{\psi(2S)}$

OUR FIT includes measurements of $m_{\psi(2S)}$, $m_{\psi(3770)}$, and $m_{\psi(3770)} - m_{\psi(2S)}$.

FIT INFORMATION

An overall fit to the total width, a partial width, and 3 branching ratios uses 23 measurements to determine 4 parameters. The overall fit has a $\chi^2 = 20.1$ for 19 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta p_i \delta p_j \rangle / (\delta p_i \cdot \delta p_j)$, in percent, from the fit to parameters p_i, including the branching fractions, $x_i \equiv \Gamma_i / \Gamma_{\rm total}$.

[1] Solution I of the two solutions.
[2] Taking into account interference between the resonant and non-resonant $D\overline{D}$ production.
[3] Reanalysis of data presented in BAI 02C. From a global fit over the center-of-mass energy region 3.7–5.0 GeV covering the $\psi(3770)$, $\psi(4040)$, $\psi(4160)$, and $\psi(4415)$ resonances. Phase angle fixed in the fit to $\delta = 0^\circ$.
[4] Interference between the resonant and non-resonant $D\overline{D}$ production not taken into account.
[5] BESSON 06 (as corrected in BESSON 10) measure $\sigma(e^+ e^- \to \psi(3770) \to$ hadrons) $= 6.36 \pm 0.08^{+0.41}_{-0.30}$ nb at $\sqrt{s} = 3773 \pm 1$ MeV, and obtain Γ_{ee} from the Born-level cross section calculated using $\psi(3770)$ mass and width from our 2004 edition, PDG 04.
[6] From the joint analysis of the data on the $D\overline{D}$ and inclusive hadronic cross sections in the $\psi(3770)$ region from BaBar, Belle, BES-II, CLEO and KEDR.
[7] Solution II of the two solutions.
[8] See also $\Gamma(e^+ e^-)/\Gamma_{\rm total}$ below.

[1] ABLIKIM 16B reports $(1.94 \pm 0.42 \pm 0.64) \times 10^{-3}$ from a measurement of $[\Gamma(\psi(3770) \to \gamma\chi_{c1})/\Gamma_{total}]$ / $[B(\psi(2S) \to \gamma\chi_{c1}(1P))]$ assuming $B(\psi(2S) \to \gamma\chi_{c1}(1P)) = (9.55 \pm 0.31) \times 10^{-2}$, which we rescale to our best (shown rounded) value $B(\psi(2S) \to \gamma\chi_{c1}(1P)) = (9.85 \pm 0.26) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best (shown rounded) value.
[2] ABLIKIM 14H reports $[\Gamma(\psi(3770) \to \gamma\chi_{c1})/\Gamma_{total}] \times [B(\chi_{c1}(1P) \to K^0_S K^\pm\pi^\mp)] = (8.51 \pm 2.39 \pm 1.42) \times 10^{-6}$ which we divide by our best (shown rounded) value $B(\chi_{c1}(1P) \to K^0_S K^\pm\pi^\mp) = 0.00346 \pm 0.00030$. Our first error is their experiment's error and our second error is the systematic error from using our best (shown rounded) value. We have calculated the best value of $B(\chi_{c1}(1P) \to K^0_S K^\pm\pi^\mp)$ as 1/2 of $B(\chi_{c1}(1P) \to \overline{K}^0 K^+\pi^- + \text{c.c.}) = (6.9 \pm 0.6) \times 10^{-3}$.
[3] Averages the two measurements from COAN 06A and BRIERE 06.
[4] Uses $B(\psi(2S) \to \gamma\chi_{c1}) = 9.07 \pm 0.11 \pm 0.54$ % from ATHAR 04, $\psi(2S)$ mass and width from PDG 04, and $\Gamma_{ee}(\psi(2S)) = 2.54 \pm 0.03 \pm 0.11$ keV from ADAM 06.
[5] Using $\Gamma_{ee}(\psi(2S)) = (2.54 \pm 0.03 \pm 0.11)$ keV from ADAM 06 and taking $\sigma(e^+e^- \to D\overline{D})$ from HE 05 for $\sigma(e^+e^- \to \psi(3770))$.

$\psi_2(3823)$

$I^G(J^{PC}) = 0^-(2^{--})$
I, J, P need confirmation.

was $\psi(3823)$, $X(3823)$

Seen by BHARDWAJ 13 in $B \to \chi_{c1}\gamma K$ and ABLIKIM 15S in $e^+e^- \to \pi^+\pi^-\gamma\chi_{c1}$ decays as a narrow peak in the invariant mass distribution of the $\chi_{c1}\gamma$ system. Properties consistent with the $\psi_2(1^3D_2)$ $c\overline{c}$ state.

$\psi_2(3823)$ MASS

$\chi_{c0}(3860)$

$I^G(J^{PC}) = 0^+(0^{++})$

OMITTED FROM SUMMARY TABLE

The assignment $J^P = 0^+$ is preferred over 2^+ by 2.5 sigma.

Observed by CHILIKIN 17 using full amplitude analysis of the process $e^+e^- \to J/\psi D\overline{D}$, where $D = D^0$, D^+. Not seen by AAIJ 20AI in the decay $B^+ \to D^+D^-K^+$.

$\chi_{c1}(3872)$

$I^G(J^{PC}) = 0^+(1^{++})$

also known as $X(3872)$

This state shows properties different from a conventional $q\overline{q}$ state. A candidate for an exotic structure. See the review on non-$q\overline{q}$ states.

First observed by CHOI 03 in $B \to K\pi^+\pi^- J/\psi(1S)$ decays as a narrow peak in the invariant mass distribution of the $\pi^+\pi^- J/\psi(1S)$ final state. Isovector hypothesis excluded by AUBERT 05B and CHOI 11.

AAIJ 13Q perform a full five-dimensional amplitude analysis of the angular correlations between the decay products in $B^+ \to \chi_{c1}(3872)K^+$ decays, where $\chi_{c1}(3872) \to J/\psi\pi^+\pi^-$ and $J/\psi \to \mu^+\mu^-$, which unambiguously gives the $J^{PC} = 1^{++}$ assignment under the assumption that the $\pi^+\pi^-$ and J/ψ are in an S-wave. AAIJ 15AO extend this analysis with more data to limit D-wave contributions to $< 4\%$ at 95% CL.

See the review on "Spectroscopy of Mesons Containing Two Heavy Quarks."

$\chi_{c1}(3872)$ T-MATRIX POLE $\sqrt{s}$ relative to D^0D^{*+} threshold

VALUE (MeV)	DOCUMENT ID		TECN	COMMENT
$(0.01 \pm 0.15^{+0.07}_{-0.08} \pm 0.07) - i(0.19 \pm 0.08^{+0.14}_{-0.19})$ **OUR ESTIMATE**				
$(0.01 \pm 0.15^{+0.07}_{-0.08} \pm 0.07) - i(0.19 \pm 0.08^{+0.14}_{-0.19})$	[1,2] ABLIKIM	24C	BES3	$e^+e^- \to \gamma\chi_{c1}(3872)$

[1] From simultaneous line shape fits of $e^+e^- \to \gamma\chi_{c1}(3872) \to \gamma[D^0\overline{D}^0\pi^0]$ and $\gamma[J/\psi\pi^+\pi^-]$. The most prominent pole is reported at $7.04 \pm 0.15^{+0.07}_{-0.08}$ MeV above the $D^0\overline{D}^0\pi^0$ threshold of 3864.66 MeV on the first sheet with respect to the $D^{*0}\overline{D}^0$ channel. The uncertainty in the D^0 width is included in the uncertainty of the pole mass.

[2] The final uncertainty on the real part of the pole location comes from the uncertainty in the D^- and D^{*0} meson masses.

Meson Particle Listings

$\chi_{c1}(3872)$

$\chi_{c1}(3872)$ T-MATRIX POLE $\sqrt{s}$

[1] Calculated from $m_{\chi_{c1}(3872)} - m_{\psi(2S)} = 185.54 \pm 0.06$ MeV obtained by combining the data with $\chi_{c1}(3872)$ produced in B^+ decays from AAIJ 20S and inclusive b-hadron decays from AAIJ 20AD and using $m_{\psi(2S)} = 3686.097$ MeV. Breit-Wigner parametrization.
[2] The mass difference for the $\chi_{c1}(3872)$ produced in B^+ and B^0 decays is $(-0.71 \pm 0.96 \pm 0.19)$ MeV.
[3] Width consistent with detector resolution.
[4] A possible equal mixture of two states with a mass difference greater than 3.6 MeV/c^2 is excluded at 95% CL.
[5] Calculated from the corresponding $m_{\chi_{c1}(3872)} - m_{J/\psi}$ using $m_{J/\psi}$=3096.916 MeV.
[6] From a fit of a relativistic S-wave Breit-Wigner convolved with the detector resolution. The width of $\chi_{c1}(3872)$ is constrained to the PDG 22 value. Systematic errors not evaluated.
[7] Using $\chi_{c1}(3872)$ produced in inclusive b-hadron decays and $m_{\psi(2S)} = 3686.097 \pm 0.010$ MeV. Breit-Wigner parametrization. Superseded by the combined value in AAIJ 20S.
[8] Using Breit-Wigner parametrization. Superseded by the combined value in AAIJ 20S.
[9] Fit with fixed width and including two resonances, $\chi_{c0}(3915)$ and $X(3960)$.
[10] Could be a different state.
[11] Calculated from the corresponding $m_{\chi_{c1}(3872)} - m_{\psi(2S)}$ using $m_{\psi(2S)} = 3686.093$ MeV. Superseded by AUBERT 08Y.
[12] Calculated from the corresponding $m_{\chi_{c1}(3872)} - m_{\psi(2S)}$ using $m_{\psi(2S)} = 3685.96$MeV. Superseded by AUBERT 06.
[13] Superseded by AALTONEN 09AU.
[14] Superseded by CHOI 11.
[15] A lower mass value can be due to an incorrect momentum scale for soft pions.

$\chi_{c1}(3872)$ MASS FROM $\overline{D}{}^{*0}D^0$ MODE

VALUE (MeV)	EVTS	DOCUMENT ID		TECN	COMMENT
• • • We do not use the following data for averages, fits, limits, etc. • • •					
$3873.71 \; {}^{+0.56}_{-0.50} \pm 0.13$		[1] HIRATA	23	BELL	$B^0 \to D^0\overline{D}{}^{*0}K^0$, $B^+ \to D^0\overline{D}{}^{*0}K^+$
$3872.9 \; {}^{+0.6}_{-0.4} \; {}^{+0.4}_{-0.5}$	50	[2,3] AUSHEV	10	BELL	$B \to \overline{D}{}^{*0}D^0K$

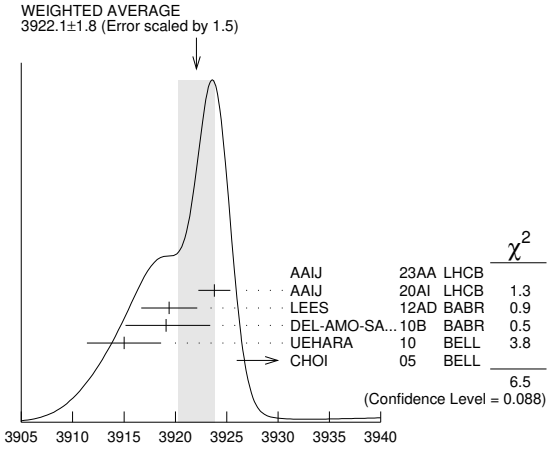
$\chi_{c0}(3915)$

Int. J. Mod. Phys. A 2026.41. Downloaded from www.worldscientific.com
by INSTITUTE OF TECHNOLOGY on 10/26/26. Re-use and distribution is strictly not permitted, except for Open Access articles.

$\chi_{c0}(3915)$ $I^G(J^{PC}) = 0^+(0^{++})$



was $X(3915)$

The $\chi_{c0}(3915)$ was originally seen by BELLE in its $\omega J/\psi$ decay mode and was produced in both B decays in CHOI 05 and $\gamma\gamma$ collisions in UEHARA 10. The J^{PC} was determined to be 0^{++} by BABAR in LEES 12AD but this assignment was questioned by ZHOU 15C. In AAIJ 20AI LHCb found the D^+D^- decay mode of the $\chi_{c0}(3915)$ using B decays and determined its J^{PC} to be 0^{++}. Based on their compatible mass, width, and J^{PC}, we assume the state decaying to $\omega J/\psi$ and the state decaying to D^+D^- are both the $\chi_{c0}(3915)$. See also the $\chi_{c2}(3930)$.

[1] $D_s^+ D_s^-$ near-threshold enhancement parameterized with a Flatte-like function .
[2] Obtained from the full amplitude analysis. Parameterized with the relativistic Breit-Wigner line shape.
[3] $\omega J/\psi$ threshold enhancement fitted as an S-wave Breit-Wigner resonance.
[4] From a simultaneous χ^2 fit to the distributions of the $\omega J/\psi$ invariant mass measured by BaBar and Belle in the processes $\gamma\gamma \to \omega J/\psi$ and $B \to \omega J/\psi K$. LHCb results also taken into account as an additional constraint in the χ^2 calculation.
[5] Not distinguished from the $\chi_{c2}(3930)$.
[6] Could also be $X(3940)$. Significance 3.1σ. Fit with additional resonance at 3963.7 ± 5.7 MeV, significance 3.4σ.

$\psi(4040)$ DECAY MODES

Due to the complexity of the $c\overline{c}$ threshold region, in this listing, "seen" ("not seen") means that a cross section for the mode in question has been measured at effective $\sqrt{s}$ near this particle's central mass value, more (less) than 2σ above zero, without regard to any peaking behavior in $\sqrt{s}$ or absence thereof. See mode listing(s) for details and references.

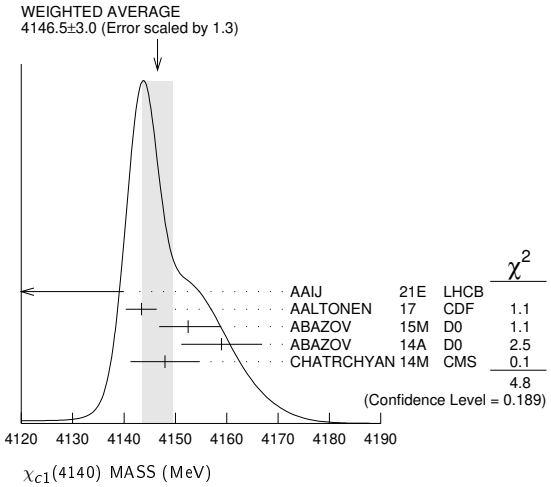
$\chi_{c1}(4140)$

$I^G(J^{PC}) = 0^+(1^{++})$

was $X(4140)$



This state shows properties different from a conventional $q\overline{q}$ state. A candidate for an exotic structure. See the review on non-$q\overline{q}$ states.

Seen by AALTONEN 09AH, ABAZOV 14A, CHATRCHYAN 14M, AAIJ 17C in $B^+ \to \chi_{c1} K^+$, $\chi_{c1} \to J/\psi\phi$, and by ABAZOV 15M separately in both prompt (4.7 σ) and non-prompt (5.6 σ) production in $p\overline{p} \to J/\psi\phi +$ anything. Not seen by SHEN 10 in $\gamma\gamma \to J/\psi\phi$ and ABLIKIM 15 in $e^+e^- \to \gamma J/\psi\phi$ at $\sqrt{s} = 4.23, 4.26, 4.36$ GeV.

Meson Particle Listings

$\psi(4160)$

$\psi(4160)$ [a]

$I^G(J^{PC}) = 0^-(1^{--})$

[a] J^{PC} known by production in e^+e^- via single photon annihilation. I^G is not known; interpretation of this state as a single resonance is unclear because of the expectation of substantial threshold effects in this energy region.

$\psi(4160)$ MASS

$\psi(4160)$ DECAY MODES

Due to the complexity of the $c\overline{c}$ threshold region, in this listing, "seen" ("not seen") means that a cross section for the mode in question has been measured at effective $\sqrt{s}$ near this particle's central mass value, more (less) than 2σ above zero, without regard to any peaking behavior in $\sqrt{s}$ or absence thereof. See mode listing(s) for details and references.

[1] Reanalysis of data presented in BAI 02C. From a global fit over the center-of-mass energy region 3.7–5.0 GeV covering the $\psi(3770)$, $\psi(4040)$, $\psi(4160)$, and $\psi(4415)$ resonances. Phase angle fixed in the fit to $\delta = (293 \pm 57)^\circ$.
[2] Reanalysis of data presented in BAI 00 and BAI 02C. From a global fit over the center-of-mass energy 3.8–4.8 GeV covering the $\psi(4040)$, $\psi(4160)$ and $\psi(4415)$ resonances and including interference effects. Four sets of solutions are obtained with the same fit quality, mass and total width, but with different e^+e^- partial widths. We quote only the range of values.
[3] From a fit to Crystal Ball (OSTERHELD 86) data.
[4] From a fit to BES (BAI 02C) data.

$X(4160)$

$I^G(J^{PC}) = ?^?(?^{??})$

OMITTED FROM SUMMARY TABLE

Seen by PAKHLOV 08 in $e^+e^-\to J/\psi X$, $X\to D^*\overline{D}^*$

A state with consistent mass and width is seen by AAIJ 21E in $B^+\to X(4160)K^+$ with $X(4160)\to J/\psi\phi$ using an amplitude analysis of $B^+\to J/\psi\phi K^+$ with a significance (accounting for systematic uncertainties) of 4.8 σ. The $J^{PC}=2^{-+}$ assignment is favored over other assignments with a significance of more than 4 σ.

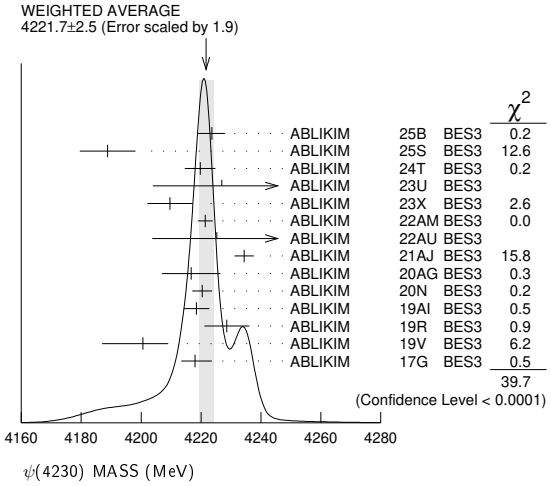
$\psi(4230)$

$I^G(J^{PC}) = 0^-(1^{--})$

also known as $Y(4230)$; was $\psi(4260)$

The original $\psi(4260)$ (also known as $Y(4260)$) was observed by AUBERT,B 05I as a peak in the energy dependence of the $e^+e^-\to\pi^+\pi^- J/\psi$ cross section and was confirmed by HE 06B, YUAN 07, LEES 12AC, and LIU 13B in the same process. A higher-statistics analysis by ABLIKIM 17B revealed an asymmetry in the cross section and resulted in a shift of the peak position to a lower mass. The $\psi(4260)$ was therefore renamed $\psi(4230)$. The energy-dependent cross sections for e^+e^- to other channels also exhibit peaks in the same mass region. The parameters corresponding to those peaks are also listed here, but the number of states in this region remains to be determined.



For details see the review on "Spectroscopy of mesons containing two heavy quarks."

[1] Using three coherent Breit-Wigner functions between 4.009 and 4.950 GeV.
[2] Also consistent with $\psi(4160)$.
[3] From a three-resonance fit to the Born cross section in the range $\sqrt{s}$ = 3.808–4.951 GeV. Supersedes ABLIKIM 20O.
[4] From a three-resonance fit to the dressed cross section in the range $\sqrt{s}$ = 4.128–4.950 GeV.
[5] From a cross-section measurement of $e^+e^- \to D^{*0}D^{*-}\pi^+$ between 4.189 and 4.951 GeV, assuming a coherent sum of 3 Breit-Wigner resonances plus a continuum amplitude. The two other resonances have masses (widths) 4675.3 ± 29.7 (218.3 ± 73.5) MeV and 4469.1 ± 26.4 (246.3 ± 37.9) MeV.
[6] From a three-resonance fit to the Born cross section in the range $\sqrt{s}$ = 3.7730–4.7008 GeV.
[7] From a two-resonance fit to the dressed cross section in the range $\sqrt{s}$ = 4.127–4.600 GeV. The second resonance has a mass of 4484.7 ± 13.3 ± 24.1 MeV and a total width of 111.1 ± 30.1 ± 15.2 MeV.
[8] From a three-resonance fit to the Born cross section in the range $\sqrt{s}$ = 4.008–4.698 GeV.
[9] Solution 1 of 8 with equal fit quality to the $e^+e^- \to \mu^+\mu^-$ cross section between 3.8 and 4.6 GeV to the coherent sum of four resonant amplitudes. Other solutions range from 4212.8 ± 7.2 ± 4.0 to 4219.4 ± 11.2 ± 4.1 MeV.
[10] From a fit of the measured cross section in the range $\sqrt{s}$ = 3.808–4.600 GeV.
[11] From a fit of the measured cross section from $\sqrt{s}$ = 4.178–4.278 GeV. Supersedes ABLIKIM 15C.
[12] Simultaneous fit to $\chi_{c1} \to \omega J/\psi$ and $\chi_{c1} \to \pi^+\pi^- J/\psi$.
[13] Average of the processes $\pi^\pm Z_c(3900)^\mp$ and $f_0(980)\,J/\psi$. Not independent from ABLIKIM 22AM.
[14] From a three-resonance fit. Superseded by ABLIKIM 22AM.
[15] From a fit to the cross section for $e^+e^- \to \pi^+\pi^-\psi(2S) \to 2(\pi^+\pi^-)\ell^+\ell^-$ obtained from 16 center-of-mass energies between 4.008 and 4.600 GeV and comprising 5.1 fb^{-1}. Superseded by ABLIKIM 21AJ.
[16] From a three-resonance fit.
[17] From a combined fit of BELLE, BABAR and BES3 $e^+e^- \to \pi^+\pi^- J/\psi$ and $e^+e^- \to \pi^+\pi^-\psi(2S)$ data.
[18] From a 3-parameter fit of measured cross sections from $\sqrt{s}$ = 4.21–4.42 GeV to a phase-space modified Breit-Wigner function, using the decays $\chi_{c0} \to \pi^+\pi^-$, $\chi_{c0} \to K^+K^-$, and $\omega \to \pi^+\pi^-\pi^0$.
[19] From a two-resonance fit.
[20] From a single-resonance fit. Supersedes AUBERT,B 05I.
[21] Superseded by LIU 13B.
[22] From a single-resonance fit. Two interfering resonances are not excluded. Superseded by LEES 12AC.

[1] Using three coherent Breit-Wigner functions between 4.009 and 4.950 GeV.
[2] From a three-resonance fit to the Born cross section in the range $\sqrt{s}$ = 3.808–4.951 GeV. Supersedes ABLIKIM 20O.
[3] From a fit to the cross section for $e^+e^- \to D^+D^-\pi^+\pi^-$ in the range $\sqrt{s}$ = 4.190–4.946 GeV.
[4] From a three-resonance fit to the Born cross section in the range $\sqrt{s}$ = 3.7730–4.7008 GeV. Parameters depend on the existence or non-existence of a state near 4.5 GeV.
[5] From a three-resonance fit to the Born cross section in the range $\sqrt{s}$ = 4.008–4.698 GeV.
[6] From a five-resonance fit to the cross section for $e^+e^- \to \gamma\gamma J/\psi \to \gamma\gamma\ell^+\ell^-$.
[7] From a two-resonance fit. Supersedes WANG 07D.
[8] From a two-resonance fit.
[9] From a fit to the $e^+e^- \to \pi^+\pi^-\psi(3823)$ cross section between 4.23 and 4.70 GeV with two coherent Breit-Wigner resonances. The data is also consistent with a single peak with mass 4417.5 ± 26.2 ± 3.5 MeV and width 245 ± 48 ± 13 MeV.
[10] From a fit of the measured cross section in the range $\sqrt{s}$ = 3.808–4.600 GeV.
[11] From a three-resonance fit. Superseded by ABLIKIM 22AM.
[12] From a fit to the cross section for $e^+e^- \to \pi^+\pi^-\psi(2S) \to 2(\pi^+\pi^-)\ell^+\ell^-$ obtained from 16 center-of-mass energies between 4.008 and 4.600 GeV and comprising 5.1 fb^{-1}. Superseded by ABLIKIM 21AJ.
[13] From a three-resonance fit.
[14] From a combined fit of BELLE, BABAR and BES3 $e^+e^- \to \pi^+\pi^- J/\psi$ and $e^+e^- \to \pi^+\pi^-\psi(2S)$ data.
[15] From a combined fit of AUBERT 07S and WANG 07D data with two resonances.
[16] From a single-resonance fit. Systematic errors not estimated.

$\psi(4415)$ [a]

$I^G(J^{PC}) = 0^-(1^{--})$

[a] J^{PC} known by production in e^+e^- via single photon annihilation. I^G is not known; interpretation of this state as a single resonance is unclear because of the expectation of substantial threshold effects in this energy region.

$\psi(4415)$ DECAY MODES

Due to the complexity of the $c\overline{c}$ threshold region, in this listing, "seen" ("not seen") means that a cross section for the mode in question has been measured at effective $\sqrt{s}$ near this particle's central mass value, more (less) than 2σ above zero, without regard to any peaking behavior in $\sqrt{s}$ or absence thereof. See mode listing(s) for details and references.

1.25±0.28±0.35	[17,18] ABLIKIM	20AG	BES3	$e^+e^- \to \mu^+\mu^-$

[17] From a fit to the $e^+e^- \to \mu^+\mu^-$ cross section between 3.8 and 4.6 GeV to the coherent sum of four resonant amplitudes assuming $\Gamma(\mu^+\mu^-) = \Gamma(e^+e^-)$.

[18] From solution 1 of 8 with equal fit quality. Other solutions range from 1.24 ± 0.28 ± 0.35 to 1.27 ± 0.41 ± 0.36 keV.

$\chi_{c1}(4685)$

$I^G(J^{PC}) = 0^+(1^{++})$

OMITTED FROM SUMMARY TABLE

This state shows properties different from a conventional $q\overline{q}$ state. A candidate for an exotic structure. See the review on "Heavy Non-$q\overline{q}$ Mesons."

Seen by AAIJ 21E in $B^+ \to \chi_{c1}(4685)K^+$ with $\chi_{c1}(4685) \to J/\psi\phi$ using an amplitude analysis of $B^+ \to J/\psi\phi K^+$ with a significance (accounting for systematic uncertainties) of 15 σ. The $J^P = 1^+$ assignment is favored with high significance.

$b\bar{b}$ MESONS (including possibly non-$q\bar{q}$ states)

Updated March 2024.

The level scheme of meson states containing a minimal quark content of $b\bar{b}$ and having $S = C = B = 0$. The name of a state is determined by its quantum numbers $I^G J^{PC}$ (see the review "Naming Scheme for Hadrons"). States included in the Summary Tables are shown with solid lines; those requiring confirmation are shown with dotted lines. The arrows indicate the most dominant hadronic transitions. Single photon transitions, including $\Upsilon(nS) \to \gamma\eta_b(mS)$, $\Upsilon(nS) \to \gamma\chi_{bJ}(mP)$, and $\chi_{bJ}(nP) \to \gamma\Upsilon(mS)$, are omitted for clarity. For orientation, the location of the thresholds related to a pair of ground state open bottom mesons is indicated in the figure. Decays to open flavour final states are not shown in the figure. The transitions $\Upsilon(10753) \to \omega\chi_{b1}(1P), \omega\chi_{b2}(1P)$ have also been reported.

WIDTH DETERMINATIONS OF THE Υ STATES

As is the case for the $J/\psi(1S)$ and $\psi(2S)$, the full widths of the $b\bar{b}$ states $\Upsilon(1S)$, $\Upsilon(2S)$, and $\Upsilon(3S)$ are not directly measurable, since they are much narrower than the energy resolution of the e^+e^- storage rings where these states are produced. The common indirect method to determine Γ starts from

$$\Gamma = \Gamma_{\ell\ell}/B_{\ell\ell} \ , \tag{1}$$

where $\Gamma_{\ell\ell}$ is one leptonic partial width and $B_{\ell\ell}$ is the corresponding branching fraction ($\ell = e,\ \mu$, or τ). One then assumes e-μ-τ universality and uses

$$\Gamma_{\ell\ell} = \Gamma_{ee}$$

$$B_{\ell\ell} = \text{average of } B_{ee},\ B_{\mu\mu}, \text{ and } B_{\tau\tau} \ . \tag{2}$$

The electronic partial width Γ_{ee} is also not directly measurable at e^+e^- storage rings, only in the combination $\Gamma_{ee}\Gamma_{\rm had}/\Gamma$, where $\Gamma_{\rm had}$ is the hadronic partial width and

$$\Gamma_{\rm had} + 3\Gamma_{ee} = \Gamma \ . \tag{3}$$

This combination is obtained experimentally from the energy-integrated hadronic cross section

$$\int_{\text{resonance}} \sigma(e^+e^- \to \Upsilon \to \text{hadrons})dE$$

$$= \frac{6\pi^2}{M^2}\frac{\Gamma_{ee}\Gamma_{\rm had}}{\Gamma}C_r = \frac{6\pi^2}{M^2}\frac{\Gamma_{ee}^{(0)}\Gamma_{\rm had}}{\Gamma}C_r^{(0)} \ , \tag{4}$$

where M is the Υ mass, and C_r and $C_r^{(0)}$ are radiative correction factors. C_r is used for obtaining Γ_{ee} as defined in Eq. (1), and

Int. J. Mod. Phys. A 2026.41. Downloaded from www.worldscientific.com

contains corrections from all orders of QED for describing $(b\bar{b}) \to e^+e^-$. The lowest order QED value $\Gamma_{ee}^{(0)}$, relevant for comparison with potential-model calculations, is defined by the lowest order QED graph (Born term) alone, and is about 7% lower than Γ_{ee}.

The Listings give experimental results on B_{ee}, $B_{\mu\mu}$, $B_{\tau\tau}$, and $\Gamma_{ee}\Gamma_{\rm had}/\Gamma$. The entries of the last quantity have been re-evaluated consistently using the correction procedure of KURAEV 85 [1]. The partial width Γ_{ee} is obtained from the average values for $\Gamma_{ee}\Gamma_{\rm had}/\Gamma$ and $B_{\ell\ell}$ using

$$\Gamma_{ee} = \frac{\Gamma_{ee}\Gamma_{\rm had}}{\Gamma(1-3B_{\ell\ell})} \ . \qquad (5)$$

The total width Γ is then obtained from Eq. (1). We do not list Γ_{ee} and Γ values of individual experiments. The Γ_{ee} values in the Meson Summary Table are also those defined in Eq. (1).

[1] Observed in prompt pp production.
[2] Reanalysis of MD1 data using the electron mass from COHEN 87, the radiative corrections from KURAEV 85 and interference effects.
[3] Obtained by reanalysing CUSB data (MACKAY 84), but not authored by the CUSB collaboration.
[4] Reanalysis of BARU 92B and ARTAMONOV 84 using new electron mass (COHEN 87).
[5] Superseded by SHAMOV 23.
[6] Supersedes BARU 86.
[7] Superseded by ARTAMONOV 00.
[8] Value includes data of ARTAMONOV 82.
[9] Reanalysed by SHAMOV 23.

3.4 ±0.4 ±0.4		GILES	83	CLEO	$e^+e^- \to \tau^+\tau^-$

[1] BESSON 07 reports $[\Gamma(\Upsilon(1S) \to \tau^+\tau^-)/\Gamma_{\text{total}}] / [B(\Upsilon(1S) \to \mu^+\mu^-)] = 1.02 \pm 0.02 \pm 0.05$ which we multiply by our best (shown rounded) value $B(\Upsilon(1S) \to \mu^+\mu^-) = (2.48 \pm 0.04) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best (shown rounded) value.
[2] Using $B(\Upsilon(1S) \to ee) = B(\Upsilon(1S) \to \mu\mu) = 0.0256$; not used for width evaluations.

[1] Using $B(f_2'(1525) \to K\overline{K}) = 0.887 \pm 0.022$ and $B(K^0\overline{K}^0) = 1/2\ B(K\overline{K})$.

[2] BESSON 11 reports $(4.0 \pm 1.3 \pm 0.6) \times 10^{-5}$ from a measurement of $[\Gamma(\Upsilon(1S) \to \gamma f_2'(1525))/\Gamma_{total}] \times [B(f_2'(1525) \to K\overline{K})]$ assuming $B(f_2'(1525) \to K\overline{K}) = (88.8 \pm 3.1) \times 10^{-2}$, which we rescale to our best (shown rounded) value $B(f_2'(1525) \to K\overline{K}) = (88.8 \pm 2.2) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best (shown rounded) value. The result also assumes $B(K^0_S \to \pi^+\pi^-) = (69.20 \pm 0.05)\%$ and $B(f_2'(1525) \to K\overline{K}) = 4\ B(f_2'(1525) \to K^0_S K^0_S)$.

[3] Assuming $B(f_2'(1525) \to K\overline{K}) = 0.71$.

$\chi_{b0}(1P)$

$I^G(J^{PC}) = 0^+(0^{++})$

J needs confirmation.

Observed in radiative decay of the $\Upsilon(2S)$, therefore $C = +$. Branching ratio requires E1 transition, M1 is strongly disfavored, therefore $P = +$.

[1] LEES 14M quotes $\Gamma(\chi_{b0}(1P) \to \gamma\,\Upsilon(1S))/\Gamma_{\rm total} \times \Gamma(\Upsilon(2S) \to \gamma\chi_{b0}(1P))/\Gamma_{\rm total} = (7.75 \pm 0.91) \times 10^{-4}$ combining the results from samples of $\Upsilon(2S) \to \gamma\gamma\mu^+\mu^-$ with and without converted photons. Assumes $B(\Upsilon(1S) \to \mu^+\mu^-) = (2.48 \pm 0.05)\%$.

[2] LEES 14M reports $[\Gamma(\chi_{b0}(1P) \to \gamma\,\Upsilon(1S))/\Gamma_{\rm total}] \times [B(\Upsilon(2S) \to \gamma\chi_{b0}(1P))] = (7.75 \pm 0.91) \times 10^{-4}$ which we divide by our best (shown rounded) value $B(\Upsilon(2S) \to \gamma\chi_{b0}(1P)) = (3.8 \pm 0.4) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best (shown rounded) value.

[3] Assuming $B(\Upsilon(1S) \to \ell^+\ell^-) = (2.48 \pm 0.05)\%$.

[4] KORNICER 11 reports $[\Gamma(\chi_{b0}(1P) \to \gamma\,\Upsilon(1S))/\Gamma_{\rm total}] \times [B(\Upsilon(2S) \to \gamma\chi_{b0}(1P))] = (6.59 \pm 0.96 \pm 0.60) \times 10^{-4}$ which we divide by our best (shown rounded) value $B(\Upsilon(2S) \to \gamma\chi_{b0}(1P)) = (3.8 \pm 0.4) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best (shown rounded) value.

[5] LEES 11J quotes a central value of $\Gamma(\chi_{b0}(1P) \to \gamma\,\Upsilon(1S))/\Gamma_{\rm total} \times \Gamma(\Upsilon(2S) \to \gamma\chi_{b0}(1P))/\Gamma_{\rm total} = (8.3 \pm 5.6^{+3.7}_{-2.6}) \times 10^{-4}$.

$\chi_{b1}(1P)$

$I^G(J^{PC}) = 0^+(1^{++})$
J needs confirmation.

Observed in radiative decay of the $\Upsilon(2S)$, therefore $C = +$. Branching ratio requires E1 transition, M1 is strongly disfavored, therefore $P = +$. $J = 1$ from SKWARNICKI 87.

[1] FULSOM 18 reports $[\Gamma(\chi_{b1}(1P) \to \gamma\Upsilon(1S))/\Gamma_{total}] \times [B(\Upsilon(2S) \to \gamma\chi_{b1}(1P))] = (2.45 \pm 0.02^{+0.11}_{-0.15}) \times 10^{-2}$ which we divide by our best (shown rounded) value $B(\Upsilon(2S) \to \gamma\chi_{b1}(1P)) = (6.9 \pm 0.4) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best (shown rounded) value.

[2] LEES 14M quotes $\Gamma(\chi_{b1}(1P) \to \gamma\Upsilon(1S))/\Gamma_{total} \times \Gamma(\Upsilon(2S) \to \gamma\chi_{b1}(1P))/\Gamma_{total} = (2.51 \pm 0.12)$ % combining the results from samples of $\Upsilon(2S) \to \gamma\gamma\mu^+\mu^-$ with and without converted photons.

[3] LEES 14M reports $[\Gamma(\chi_{b1}(1P) \to \gamma\Upsilon(1S))/\Gamma_{total}] \times [B(\Upsilon(2S) \to \gamma\chi_{b1}(1P))] = (2.51 \pm 0.12) \times 10^{-2}$ which we divide by our best (shown rounded) value $B(\Upsilon(2S) \to \gamma\chi_{b1}(1P)) = (6.9 \pm 0.4) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best (shown rounded) value.

[4] Assuming $B(\Upsilon(1S) \to \mu^+\mu^-) = (2.48 \pm 0.05)$%.

[5] KORNICER 11 reports $[\Gamma(\chi_{b1}(1P) \to \gamma\Upsilon(1S))/\Gamma_{total}] \times [B(\Upsilon(2S) \to \gamma\chi_{b1}(1P))] = (22.8 \pm 0.4 \pm 1.2) \times 10^{-3}$ which we divide by our best (shown rounded) value $B(\Upsilon(2S) \to \gamma\chi_{b1}(1P)) = (6.9 \pm 0.4) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best (shown rounded) value.

[6] LEES 11J reports $[\Gamma(\chi_{b1}(1P) \to \gamma\Upsilon(1S))/\Gamma_{total}] \times [B(\Upsilon(2S) \to \gamma\chi_{b1}(1P))] = (24.1 \pm 0.6 \pm 1.5) \times 10^{-3}$ which we divide by our best (shown rounded) value $B(\Upsilon(2S) \to \gamma\chi_{b1}(1P)) = (6.9 \pm 0.4) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best (shown rounded) value.

[7] WALK 86 quotes $B(\Upsilon(2S) \to \gamma\chi_{b1}(1P)) \times B(\chi_{b1}(1P) \to \gamma\Upsilon(1S)) \times B(\Upsilon(1S) \to \ell^+\ell^-) = (5.8 \pm 0.9 \pm 0.7)$ %.

[8] WALK 86 reports $[\Gamma(\chi_{b1}(1P) \to \gamma\Upsilon(1S))/\Gamma_{total}] \times [B(\Upsilon(2S) \to \gamma\chi_{b1}(1P))] = (23.4 \pm 3.63 \pm 2.82) \times 10^{-3}$ which we divide by our best (shown rounded) value $B(\Upsilon(2S) \to \gamma\chi_{b1}(1P)) = (6.9 \pm 0.4) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best (shown rounded) value.

$\chi_{b2}(1P)$

$I^G(J^{PC}) = 0^+(2^{++})$
J needs confirmation.

Observed in radiative decay of the $\Upsilon(2S)$, therefore $C = +$. Branching ratio requires E1 transition, M1 is strongly disfavored, therefore $P = +$. $J = 2$ from SKWARNICKI 87.

FIT INFORMATION

An overall fit to 3 branching ratios uses 13 measurements to determine 2 parameters. The overall fit has a $\chi^2 = 11.8$ for 11 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \cdot \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{\text{total}}$.

$\Upsilon(2S)$ $\Gamma(i)\Gamma(e^+e^-)/\Gamma(\text{total})$

$\Upsilon_2(1D)$

$I^G(J^{PC}) = 0^-(2^{--})$

was $\Upsilon(1D)$

First observed by BONVICINI 04 in the decay to $\gamma\gamma\,\Upsilon(1S)$ and confirmed by DEL-AMO-SANCHEZ 10R in the decay to $\pi^+\pi^-\,\Upsilon(1S)$. Data consistent with $J^P = 2^-$. The states with $J = 1$ and 3 also possibly seen, but need confirmation.

$\chi_{b0}(2P)$

$I^G(J^{PC}) = 0^+(0^{++})$
J needs confirmation.

Observed in radiative decay of the $\Upsilon(3S)$, therefore $C = +$. Branching ratio requires E1 transition, M1 is strongly disfavored, therefore $P = +$.

$\chi_{b1}(2P)$

$I^G(J^{PC}) = 0^+(1^{++})$
J needs confirmation.

Observed in radiative decay of the $\Upsilon(3S)$, therefore $C = +$. Branching ratio requires E1 transition, M1 is strongly disfavored, therefore $P = +$.

$\chi_{b2}(2P)$

$I^G(J^{PC}) = 0^+(2^{++})$
J needs confirmation.

Observed in radiative decay of the $\Upsilon(3S)$, therefore $C = +$. Branching ratio requires E1 transition, M1 is strongly disfavored, therefore $P = +$.

[1] From a simultaneous fit to the $\Upsilon(nS)\pi^+\pi^-$, $n = 1, 2, 3$, cross sections at 28 energy points within $\sqrt{s} = 10.6$–11.05 GeV, including the initial-state radiation at $\Upsilon(10860)$.
[2] From a simultaneous fit to the $h_b(nP)\pi^+\pi^-$, $n = 1, 2$ cross sections at 22 energy points within $\sqrt{s} = 10.77$–11.02 GeV to a pair of interfering Breit-Wigner amplitudes modified by phase space factors, with eight resonance parameters (a mass and width for each of $\Upsilon(10860)$ and $\Upsilon(11020)$, a single relative phase, a single relative amplitude,

Int. J. Mod. Phys. A 2026.41. Downloaded from www.worldscientific.com
by INSTITUTE OF TECHNOLOGY on 10/26/26. Re-use and distribution is strictly not permitted, except for Open Access articles.

and two overall normalization factors, one for each n). The systematic error estimate is dominated by possible interference with a small nonresonant continuum amplitude.

[3] From a fit to the dressed cross sections of AUBERT 09E by BaBar and SANTEL 16 by Belle above 10.68 GeV with a coherent sum of a continuum amplitude and three Breit-Wigner functions with constant widths.

[4] From a fit to the total hadronic cross sections measured at 60 energy points within $\sqrt{s}$ = 10.82–11.05 GeV to a pair of interfering Breit-Wigner amplitudes and two floating continuum amplitudes with $1/\sqrt{s}$ dependence, one coherent with the resonances and one incoherent, with six resonance parameters (a mass, width, and an amplitude for each of $\Upsilon(10860)$ and $\Upsilon(11020)$, one relative phase, and one decoherence coefficient).

[5] Not including uncertain and potentially large systematic errors due to assumed continuum amplitude $1/\sqrt{s}$ dependence and related interference contributions.

[6] From a simultaneous fit to the $\Upsilon(nS)\pi^+\pi^-$, n = 1, 2, 3, cross sections at 25energy points within $\sqrt{s}$ = 10.6–11.05 GeV to a pair of interfering Breit-Wigner amplitudesmodified by phase space factors, with fourteen resonance parameters (a mass, width, and threeamplitudes for each of $\Upsilon(10860)$ and $\Upsilon(11020)$, a single universal relativephase, and three decoherence coefficients, one for each n). Continuum contributions weremeasured (and therefore fixed) to be zero.

[7] Superseded by MIZUK 19.

[8] In a model where a flat non-resonant $b\overline{b}$-continuum is incoherently added to a second flat component interfering with two Breit-Wigner resonances. Systematic uncertainties not estimated.

[9] The parameters of the $\Upsilon(11020)$ are fixed to those in AUBERT 09E.

[10] In a model where a flat nonresonant $\Upsilon(1S,2S,3S)\pi^+\pi^-$ continuum interferes with a single Breit-Wigner resonance.

[11] In a model where a non-resonant $b\overline{b}$-continuum represented by a threshold function at $\sqrt{s}$=$2m_B$ is incoherently added to a flat component interfering with two Breit-Wigner resonances. Not independent of other AUBERT 09E results. Systematic uncertainties not estimated.

[12] Assuming four Gaussians with radiative tails and a single step in R.

[13] In a coupled-channel model with three resonances and a smooth step in R.

$0.472\pm0.024\pm0.072$	[3] DRUTSKOY	07	BELL	$\Upsilon(5S) \to D_s^{\pm}X$

[1] Supersedes DRUTSKOY 07.

[2] ARTUSO 05B reports $[\Gamma(\Upsilon(10860) \to D_s\ \text{anything} + \text{c.c.})/\Gamma_{\text{total}}] \times [\text{B}(D_s^+ \to \phi\pi^+)] = 0.0198 \pm 0.0019 \pm 0.0038$ which we divide by our best (shown rounded) value $\text{B}(D_s^+ \to \phi\pi^+) = (4.5 \pm 0.4) \times 10^{-2}$. Our first error is their experiment's error and our second error is the systematic error from using our best (shown rounded) value.

[3] Using $\text{B}(D_s^+ \to \phi\pi^+) = (4.4 \pm 0.6)\%$ from PDG 06.

[1] From a simultaneous fit to the $\Upsilon(\text{nS})\pi^+\pi^-$, $n = 1, 2, 3$, cross sections at 28 energy points within $\sqrt{s} = 10.6$–11.05 GeV, including the initial-state radiation at $\Upsilon(10860)$.

[2] From a simultaneous fit to the $h_b(\text{nP})\pi^+\pi^-$, $n = 1, 2$ cross sections at 22 energy points within $\sqrt{s} = 10.77$–11.02 GeV to a pair of interfering Breit-Wigner amplitudes modified by phase space factors, with eight resonance parameters (a mass and width for each of $\Upsilon(10860)$ and $\Upsilon(11020)$, a single relative phase, a single relative amplitude, and two overall normalization factors, one for each n). The systematic error estimate is dominated by possible interference with a small nonresonant continuum amplitude.

[3] From a fit to the dressed cross sections of AUBERT 09E by BaBar and SANTEL 16 by Belle above 10.68 GeV with a coherent sum of a continuum amplitude and three Breit-Wigner functions with constant widths.

[4] From a fit to the total hadronic cross sections measured at 60 energy points within $\sqrt{s} = 10.82$–11.05 GeV to a pair of interfering Breit-Wigner amplitudes and two floating continuum amplitudes with $1/\sqrt{s}$ dependence, one coherent with the resonances and one incoherent, with six resonance parameters (a mass, width, and an amplitude for each of $\Upsilon(10860)$ and $\Upsilon(11020)$, one relative phase, and one decoherence coefficient).

[5] Not including uncertain and potentially large systematic errors due to assumed continuum amplitude $1/\sqrt{s}$ dependence and related interference contributions.

[6] From a simultaneous fit to the $\Upsilon(\text{nS})\pi^+\pi^-$, $n = 1, 2, 3$, cross sections at 25energy points within $\sqrt{s} = 10.6$–11.05 GeV to a pair of interfering Breit-Wigner amplitudesmodified by phase space factors, with fourteen resonance parameters (a mass, width, and threeamplitudes for each of $\Upsilon(10860)$ and $\Upsilon(11020)$, a single universal relativephase, and three decoherence coefficients, one for each n). Continuum contributions weremeasured (and therefore fixed) to be zero.

[7] Superseded by MIZUK 19.

[8] In a model where a flat non-resonant $b\overline{b}$-continuum is incoherently added to a second flat component interfering with two Breit-Wigner resonances. Systematic uncertainties not estimated.

$T^*_{c\bar{s}0}(2900)$ $I(J^P) = 1(0^+)$

OMITTED FROM SUMMARY TABLE

Observed by LHCb in AAIJ 23B using a simultaneous amplitude analysis of $B^0 \to \overline{D}^0 D_s^+ \pi^-$ and $B^+ \to D^- D_s^+ \pi^+$. The $T^*_{c\bar{s}0}(2900)^0 \to D_s^+ \pi^-$ and $T^*_{c\bar{s}0}(2900)^{++} \to D_s^+ \pi^+$ decays are observed with 8.0 and 6.5 σ significance, respectively.

• • • We do not use the following data for averages, fits, limits, etc. • • •					
$(-356^{+39}_{-38}) - i(28 \pm 1)$		[2] DU	22	RVUE	

[1] The fit uses a coupled channel model accounting for the $D^0 D^{*+}$ threshold. The real part is given relative to the $D^0 D^{*+}$ threshold.

[2] The study provides fits results of three different coupled-channel calculations of increasing levels of sophistication to the LHCb data of AAIJ 22Z. We quote the result of the most advanced calculation with full three-body unitarity. The real part is given relative to the $D^0 D^{*+}$ threshold.

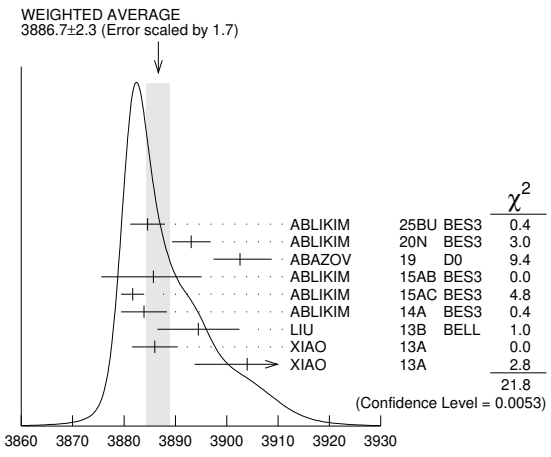
$T_{c\bar{c}1}(3900)$ $I^G(J^{PC}) = 1^+(1^{+-})$

was $Z_c(3900)$, $X(3900)$



Properties incompatible with a $q\bar{q}$ structure (exotic state). See the review on non-$q\bar{q}$ states.

Charged $T_{c\bar{c}1}(3900)^\pm$ seen as a peak in the invariant mass distribution of the $J/\psi\pi^\pm$ system by BES III (ABLIKIM 13T) in $e^+e^- \to \pi^+\pi^- J/\psi$ at c.m. energy of 4.26 GeV and by radiative return from e^+e^- collisions at $\sqrt{s}$ from 9.46 to 10.86 GeV at Belle (LIU 13B). Partial wave analysis of ABLIKIM 17J determines $J^P = 1^+$ with more than 7 σ significance. Neutral $T_{c\bar{c}1}(3900)^0$ seen in the $J/\psi\pi^0$ invariant mass distribution in $e^+e^- \to \pi^0\pi^0 J/\psi$ at c.m. energies of 4.23, 4.26, and 4.36 GeV by BES III (ABLIKIM 15U) and at 4.17 GeV by XIAO 13A. Peaks in $(D\overline{D}^*)^{0,\pm}$ reported by BES III (ABLIKIM 14A, ABLIKIM 15AB) are assumed to be related.

$T_{c\overline{c}s1}(4000)$

$I(J^P) = \frac{1}{2}(1^+)$

OMITTED FROM SUMMARY TABLE

was $Z_{cs}(4000)$

Properties incompatible with a $q\overline{q}$ structure (exotic state). See the review on "Heavy Non-$q\overline{q}$ Mesons."

Seen by AAIJ 21E in $B^+ \to T_{c\overline{c}s1}(4000)^+ \phi$ with $T_{c\overline{c}s1}(4000)^+ \to J/\psi K^+$ using an amplitude analysis of $B^+ \to J/\psi\phi K^+$ with a significance (accounting for systematic uncertainties) of 15 σ. The $J^P = 1^+$ assignment is favored with high significance. ABLIKIM 21G also reports a $J^P = 1^+$ $T_{c\overline{c}s}$ state in this mass region using $e^+e^- \to K^+(D_s^- D^{*0} + D_s^{*-} D^0)$ with a significance of 5.3 σ. The incompatible values for the widths reported by AAIJ 21E and ABLIKIM 21G could either indicate the existence of two separate states or possibly be explained in a coupled channel model (see ORTEGA 21).

$T_{c\overline{c}}(4020)$

$I^G(J^{PC}) = 1^+(?^{?-})$

was $X(4020)$

Properties incompatible with a $q\overline{q}$ structure (exotic state). See the review on non-$q\overline{q}$ states.

Charged $T_{c\overline{c}}(4020)$ seen by ABLIKIM 13X from $e^+e^- \to \pi^+\pi^- h_c(1P)$ at c.m. energy from 3.90 to 4.42 GeV as a peak in the invariant mass distribution of the $\pi^\pm h_c(1P)$ system, and by ABLIKIM 14B from $e^+e^- \to (D^*\overline{D}^*)^\pm\pi^\mp$ events in $(D^*\overline{D}^*)^\pm$ mass. A neutral $T_{c\overline{c}}(4020)$ seen by ABLIKIM 14P at three c.m. energies in the same range in $e^+e^- \to \pi^0\pi^0 h_c(1P)$ as a peak in the larger of the two masses recoiling against a π^0. ABLIKIM 15AA observes a 5.9 σ signal in $(D^*\overline{D}^*)^0$ in $e^+e^- \to (D^*\overline{D}^*)^0\,\pi^0$ events using collisions at two c.m. energies. Production rates and mass values support grouping neutral and charged $T_{c\overline{c}}(4020)$ together as manifestations of a single $I = 1$ particle.

$I^G(J^{PC}) = 1^+(1^{+-})$
I, G, C need confirmation.

OMITTED FROM SUMMARY TABLE
was $Z_c(4200)$, $X(4200)^\pm$

This state shows properties different from a conventional $q\bar{q}$ state. A candidate for an exotic structure. See the review on non-$q\bar{q}$ states.

Reported by CHILIKIN 14 in $J/\psi\pi^+$ at a significance of 6.2σ. Assignments of 0^-, 1^-, 2^-, and 2^+ excluded at 6.1σ, 7.4σ, 4.4σ, and 7.0σ level, respectively. Needs confirmation.

$2075 \pm 12 \pm 5$	$90 \pm 35 \pm 9$	[3] ABLIKIM	04J	BES2	$J/\psi \to K^-p\overline{\Lambda}$

[1] The reported mass and width are the pole positions in the complex (M, Γ) plane.

[2] Signal observed with a statistical significance $>20\sigma$ comes from 3883 candidate events. Spin parity determined to be $J^P = 1^+$ with a statistical significance $>5\sigma$ over 0^-, 1^-, 2^+ hypotheses, and in the range within 3.1–7.5 σ with respect to 2^-.

[3] From a fit in the region $M_{p\overline{\Lambda}} - M_p - M_\Lambda < 150$ MeV. S-wave in the $p\overline{\Lambda}$ system preferred. A similar near-threshold enhancement in the $p\overline{\Lambda}$ system is observed in $B^+ \to p\overline{\Lambda}D^0$ by CHEN 11F.

1.007276470	±0.000000012	COHEN	87	RVUE	1986 CODATA value

[1] FINK 21 simultaneously measure the cyclotron frequencies of an H_2^+ ion and a deuteron in a coupled magnetron orbit. The proton mass is extracted using the precise deuteron mass value.

[2] The 2018 CODATA combination in TIESINGA 21 includes data from HEISSE 17, but does not include updates in HEISSE 19, which superseded HEISSE 17. Consequently, we do not average HEISSE 19 and TIESINGA 21. Updating the 2018 CODATA combination to use HEISSE 19 would shift the central value for the proton mass upwards by less than half a standard deviation. Therefore, we take the 2018 CODATA result in TIESINGA 21 as the recommended value for the proton mass.

[3] The value is an update of HEISSE 17; the result is shifted by 1.5×10^{-11} u, corresponding to 0.45 σ due to the corrected motional temperatures of the particles. The statistical and total systematic uncertainties are given as 16 and 29 in the last two digits.

[4] The statistical and systematic errors are 15 and 29 in the last two places of the value. Superseded by HEISSE 19.

p MASS (MeV)

The mass is known more precisely in u (atomic mass units) than in MeV. The conversion is: 1 u = 931.494 103 72(29) MeV/c^2 (2022 CODATA value, MOHR 25).

<5 × 10⁻⁷		[2] TORII	99	SPEC	$\overline{p}e^-$He atom

[1] HORI 01, HORI 03, HORI 06, and HORI 11 use the more-precisely-known constraint on the $\overline{p}$ charge-to-mass ratio of GABRIELSE 99 (see below) to get their results. Their results are not independent of the HORI 01, HORI 03, HORI 06, and HORI 11 values for $|q_p+q_{\overline{p}}|/e$, below.

[2] TORII 99 uses the more-precisely-known constraint on the $\overline{p}$ charge-to-mass ratio of GABRIELSE 95 (see below) to get this result. This is not independent of the TORII 99 value for $|q_p+q_{\overline{p}}|/e$, below.

$\overline{p}/p$ CHARGE-TO-MASS RATIO, $|\frac{q_{\overline{p}}}{m_{\overline{p}}}|/(\frac{q_p}{m_p})$

A test of CPT invariance. Listed here are measurements involving the *inertial* masses. For a discussion of what may be inferred about the ratio of $\overline{p}$ and p *gravitational* masses, see ERICSON 90; they obtain an upper bound of 10^{-6}–10^{-7} for violation of the equivalence principle for $\overline{p}$'s.

VALUE		DOCUMENT ID		TECN	COMMENT
1.000 000 000 003±0.000 000 000 016 OUR AVERAGE

1.000 000 023	±0.000 000 042	[2] GABRIELSE	90	TRAP	Penning trap

[1] Equation (2) of GABRIELSE 95 should read $M(\overline{p})/M(p) = 0.999\,999\,998\,5\ (11)$ (G. Gabrielse, private communication).

[2] GABRIELSE 90 also measures $m_{\overline{p}}/m_{e^-} = 1836.152660 \pm 0.000083$ and $m_p/m_{e^-} = 1836.152680 \pm 0.000088$. Both are completely consistent with the 1986 CODATA (COHEN 87) value for m_p/m_{e^-} of 1836.152701 ± 0.000037.

$(|\frac{q_{\overline{p}}}{m_{\overline{p}}}|-\frac{q_p}{m_p})/\frac{q_p}{m_p}$

A test of CPT invariance. Taken from the $\overline{p}/p$ charge-to-mass ratio, above.

VALUE	DOCUMENT ID
(0.3±1.6) × 10⁻¹¹ OUR EVALUATION	

$|q_p + q_{\overline{p}}|/e$

A test of CPT invariance. Note that the comparison of the $\overline{p}$ and p charge-to-mass ratios given above is much better determined. See also a similar test involving the electron.

<3.2 × 10⁻²⁰	[2] SENGUPTA	00	binary pulsar
<0.8 × 10⁻²¹	MARINELLI	84	Magnetic levitation
<1.0 × 10⁻²¹	[1] DYLLA	73	Neutrality of SF_6

[1] BRESSI 11 uses the method of DYLLA 73 but finds serious errors in that experiment that greatly reduce its accuracy. The BRESSI 11 limit assumes that $n \to pe^-\nu_e$ conserves charge. Thus the limit applies equally to the charge of the neutron.

[2] SENGUPTA 00 uses the difference between the observed rate of of rotational energy loss by the binary pulsar PSR B1913+16 and the rate predicted by general relativity to set this limit. See the paper for assumptions.

p MAGNETIC MOMENT

See the "Quark Model" review.

700 ± 900	HARRISON	69	MBR	Molecular beam

[1] SAHOO 17 and DMITRIEV 03 are not direct measurements of the proton electric dipole moment. They use theory to calculate this limit from the limit on the electric dipole moment of the ^{199}Hg atom.
[2] This WILKENING 84 value includes a finite-size effect and a magnetic effect.
[3] This WILKENING 84 value is more cautious than the other and excludes the finite-size effect, which relies on uncertain nuclear integrals.

p ELECTRIC POLARIZABILITY α_p

For a very complete review of the "polarizability of the nucleon and Compton scattering," see SCHUMACHER 05, updated in SCHUMACHER 19.

See LI 22D and therein for measurements of the mean square proton electric polarizability radius.

10.9 ±2.2 ±1.3	[8] FEDERSPIEL	91	CNTR	γp Compton scattering

[1] MORNACCHI 22 perform the first simultaneous extraction of the six leading-order proton polarizabilities using fixed-t subtracted dispersion relations and a bootstrap-based fitting technique.
[2] BEANE 03 uses effective field theory and low-energy γp and γd Compton-scattering data. It also gets for the isoscalar polarizabilities (see the erratum) $\alpha_N = (13.0 \pm 1.9^{+3.9}_{-1.5}) \times 10^{-4}$ fm^3 and $\beta_N = (-1.8 \pm 1.9^{+2.1}_{-0.9}) \times 10^{-4}$ fm^3.
[3] BLANPIED 01 gives $\alpha_p + \beta_p$ and $\alpha_p - \beta_p$. The separate α_p and β_p are provided to us by A. Sandorfi. The first error above is statistics plus systematics; the second is from the model.
[4] This OLMOSDELEON 01 result uses the TAPS data alone, and does not use the (re-evaluated) sum-rule constraint that $\alpha+\beta = (13.8 \pm 0.4) \times 10^{-4}$ fm^3. See the paper for a discussion.
[5] MACGIBBON 95 combine the results of ZIEGER 92, FEDERSPIEL 91, and their own experiment to get a "global average" in which model errors and systematic errors are treated in a consistent way. See MACGIBBON 95 for a discussion.
[6] PASQUINI 19 fit data sets for the unpolarized proton RCS cross section, using fixed-t subtracted dispersion relations and a bootstrap-based fitting technique.
[7] BARANOV 01 combines the results of 10 experiments from 1958 through 1995 to get a global average that takes into account both systematic and model errors and does not use the theoretical constraint on the sum $\alpha_p + \beta_p$.
[8] FEDERSPIEL 91 obtains for the (static) electric polarizability α_p, defined in terms of the induced electric dipole moment by $\mathbf{D} = 4\pi\epsilon_0\alpha_p\mathbf{E}$, the value $(7.0 \pm 2.2 \pm 1.3) \times 10^{-4}$ fm^3.

p MAGNETIC POLARIZABILITY β_p

The electric and magnetic polarizabilities are subject to a dispersion sum-rule constraint $\overline{\alpha} + \overline{\beta} = (14.2 \pm 0.5) \times 10^{-4}$ fm^3. Errors here are anticorrelated with those on $\overline{\alpha}_p$ due to this constraint.

See LI 22D and therein for measurements of the mean square proton magnetic polarizability radius.

p CHARGE RADIUS

This is the rms electric charge radius, $\sqrt{\langle r_E^2 \rangle}$.

There are three kinds of measurements of the proton radius: via transitions in atomic hydrogen; via electron scattering off hydrogen; and via muonic hydrogen Lamb shift. Most measurements of the radius of the proton involve electron-proton interactions, the most recent of which is the electron scattering measurement XIONG 19, and the atomic-hydrogen result BEZGINOV 19. These can be compared to another atomic-hydrogen value BEYER 17 and with the best measurement using muonic hydrogen Lamb shift ANTOGNINI 13, that is far more precise.

The latest 2022 CODATA recommendation (MOHR 25) is based on much improved theory descriptions for muonic hydrogen Lamb shift and the atomic-hydrogen transitions. MOHR 25 do not include the electron scattering data because of a lack of consensus as to how the electron-scattering data should be analyzed, and there remains some tension between the different r_p measurements. See GAO 22A for an updated discussion.

See our 2014 edition (Chinese Physics **C38** 070001 (2014)) for values published before 2003.

[1] MOHR 25 do not include the electron scattering data.
[2] CUI 21 employ a new mathematical procedure (statistical SPM, Schlessinger point method) based on form-unbiased interpolations of existing *ep* scattering data.
[3] MIHOVILOVIC 21 reports a value of 0.878 ± 0.011 ± 0.031 ± 0.002 fm where the last uncertainty comes from the dependence on the model form factor function.
[4] BEZGINOV 19 measures the $2S_{1/2}$ to $2P_{1/2}$ transition frequency in atomic hydrogen using the frequency-offset separated oscillatory field (FOSOF) technique. The result agrees well with the muonic hydrogen Lamb shift value.
[5] The XIONG 19 value from $ep \to ep$ scattering and supports the muonic hydrogen Lamb shift value.
[6] FLEURBAEY 18 measures the 1S-3S transition frequency in hydrogen and in combination with the 1S-2S transition frequency deduces the proton radius and the Rydberg constant.
[7] The BEYER 17 result is 3.3 combined standard deviations below the MOHR 16 (2014 CODATA) value. The experiment measures the 2S-4P transition in hydrogen and gets the proton radius and the Rydberg constant.
[8] Authors also provide values for combinations of all available data.

p MAGNETIC RADIUS

This is the rms magnetic radius, $\sqrt{\langle r_M^2 \rangle}$.

VALUE (fm)	*DOCUMENT ID*		*TECN*	*COMMENT*
0.851 ± 0.026	[1] LEE	15		Combination of world and Mainz data
• • • We do not use the following data for averages, fits, limits, etc. • • •				
0.817 ± 0.027	[2] CUI	21B	FIT	use existing *ep* data
0.87 ± 0.02	EPSTEIN	14		Using *ep*, *en*, $\pi\pi$ data
0.867 ± 0.009 ± 0.018	ZHAN	11	SPEC	Recoil polarimetry
0.777 ± 0.013 ± 0.010	BERNAUER	10	SPEC	$ep \to ep$ form factor
0.876 ± 0.010 ± 0.016	BORISYUK	10		Reanalyzes old $ep \to ep$ data
0.854 ± 0.005	BELUSHKIN	07		Dispersion analysis

[1] In a consistent reanalysis LEE 2015 extract values separately for the Mainz 2010 data only (0.776+-0.034+-0.017) fm and for the world data without Mainz data (0.914+-0.035) fm. The quoted value is a simple combination of the two, which ignores possible discrepancies and unknown correlations and should be considered with caution.
[2] CUI 21B employ a new mathematical procedure (statistical SPM, Schlessinger point method) based on form-unbiased interpolations of existing *ep* scattering data.

p MEAN LIFE

A test of baryon conservation. See the "*p* Partial Mean Lives" section below for limits for identified final states. The limits here are to "anything" or are for "disappearance" modes of a bound proton (*p*) or (*n*). See also the 3ν modes in the "Partial Mean Lives" section. Table 1 of BACK 03 is a nice summary.

[1] ALLEGA 22 look for γ rays from the de-excitation of a residual ^{15}N* following the disappearance of *p* in ^{16}O.
[2] ALLEGA 22 look for γ rays from the de-excitation of a residual ^{15}O* following the disappearance of *n* in ^{16}O.
[3] AGOSTINI 24A look for γ rays from the de-excitation of a residual ^{75}As* following the disappearance of *p* in ^{76}Ge (through the transition chain ^{76}Ge → ^{75}Ga → ^{75}Ge → ^{75}As).
[4] AGOSTINI 24A look for γ rays from the de-excitation of a residual ^{75}As* following the disappearance of *n* in ^{76}Ge (through the transition chain ^{76}Ge → ^{75}Ge → ^{75}As).
[5] AHMED 04 and ANDERSON 19A look for γ rays from the de-excitation of a residual ^{15}O* or ^{15}N* following the disappearance of a neutron or proton in ^{16}O.
[6] ARAKI 06 looks for signs of de-excitation of the residual nucleus after disappearance of a neutron from the *s* shell of ^{12}C.
[7] BACK 03 looks for decays of unstable nuclides left after *N* decays of parent ^{12}C, ^{13}C, ^{16}O nuclei. These are "invisible channel" limits.
[8] ZDESENKO 03 gets this limit on proton disappearance in deuterium by analyzing SNO data in AHMAD 02.
[9] AHMAD 02 (see its footnote 7) looks for neutrons left behind after the disappearance of the proton in deuterons.
[10] BERNABEI 00B looks for the decay of a $^{128}_{53}$I nucleus following the disappearance of a proton in the otherwise-stable $^{129}_{54}$Xe nucleus.
[11] EVANS 77 looks for the daughter nuclide ^{129}Xe from possible ^{130}Te decays in ancient Te ore samples.
[12] This mean-life limit has been obtained from a half-life limit by dividing the latter by ln(2) = 0.693.
[13] FLEROV 58 looks for the spontaneous fission of a ^{232}Th nucleus after the disappearance of one of its nucleons.

$\overline{p}$ MEAN LIFE

Of the two astrophysical limits here, that of GEER 00D involves considerably more refinements in its modeling. The other limits come from direct observations of stored antiprotons. See also "$\overline{p}$ Partial Mean Lives" after "*p* Partial Mean Lives," below, for exclusive-mode limits. The best (lifetime/branching fraction) limit there is 7×10^5 years, for $\overline{p} \to e^- \gamma$. We advance only the exclusive-mode limits to our Summary Tables.

LIMIT (years)	*CL%*	*EVTS*	*DOCUMENT ID*		*TECN*	*COMMENT*
• • • We do not use the following data for averages, fits, limits, etc. • • •						
> 5.0	90		SELLNER	17	TRAP	Penning trap

[1] GEER 00D uses agreement between a model of galactic $\overline{p}$ production and propagation and the observed $\overline{p}/p$ cosmic-ray spectrum to set this limit.

p DECAY MODES

See the "Note on Nucleon Decay" in our 1994 edition (Phys. Rev. **D50**, 1173) for a short review.

The "partial mean life" limits tabulated here are the limits on τ/B_i, where τ is the total mean life and B_i is the branching fraction for the mode in question. For *N* decays, *p* and *n* indicate proton and neutron partial lifetimes.

Baryon Particle Listings

p PARTIAL MEAN LIVES

The "partial mean life" limits tabulated here are the limits on τ/B_i, where τ is the total mean life for the proton and B_i is the branching fraction for the mode in question.

Decaying particle: p = proton, n = bound neutron. The same event may appear under more than one partial decay mode. Background estimates may be accurate to a factor of two.

Antilepton + meson

[1] In estimating the background, this HIRATA 89C limit (as opposed to the later limits of WALL 00B and MCGREW 99) does not take into account present understanding that the flux of ν_μ originating in the upper atmosphere is depleted. Doing so would reduce the background and thus also would reduce the limit here.
[2] We have calculated 90% CL limit from 1 confined event.
[3] We have converted 2 possible events to 90% CL limit.
[4] We have converted half-life to 90% CL mean life.

[1] MATSUMOTO 22 limit $> 4500 \times 10^{30}$ is derived from the latest dataset SKA IV phase (from 2008 to 2018) with 0.20 Mton-years of exposure.
[2] MATSUMOTO 22 limit $> 3600 \times 10^{30}$ is derived from a combination of all datasets SKA I,II, III and IV phase (from 1996 to 2018) with a total of 0.37 Mton-years of exposure. Note, the limit from only SKA IV is stronger, because there were some events observed in SKA II.
[3] BARTELT 87 limit applies to $p \to \mu^+ K^0_S$.
[4] Limit based on zero events.
[5] We have calculated 90% CL limit from 1 confined event.
[6] We have converted half-life to 90% CL mean life.

n

$I(J^P) = \frac{1}{2}(\frac{1}{2}^+)$ Status: ****

We have omitted some results that have been superseded by later experiments. See our earlier editions.

Anyone interested in the neutron should look at these two review articles: D. Dubbers and M.G. Schmidt, "The neutron and its role in cosmology and particle physics," Reviews of Modern Physics **83** 1111 (2011); and F.E. Wietfeldt and G.L. Greene, "The neutron lifetime," Reviews of Modern Physics **83** 1173 (2011).

n MASS (atomic mass units u)

The mass is known much more precisely in u (atomic mass units) than in MeV. See the next data block.

VALUE (u)	*DOCUMENT ID*		*TECN*	*COMMENT*
1.00866491606±0.00000000040	MOHR	25	RVUE	2022 CODATA value
• • • We do not use the following data for averages, fits, limits, etc. • • •				
1.00866491595±0.00000000049	TIESINGA	21	RVUE	2018 CODATA value

1.00866491578±0.00000000055	MOHR	99	RVUE	1998 CODATA value
1.008665904 ±0.000000014	COHEN	87	RVUE	1986 CODATA value

n MASS (MeV)

The mass is known more precisely in u (atomic mass units) than in MeV. The conversion is: 1 u = 931.494 103 72(29) MeV/c^2 (2022 CODATA value, MOHR 25).

VALUE (MeV)		*DOCUMENT ID*		*TECN*	*COMMENT*
939.56542194±0.00000048		MOHR	25	RVUE	2022 CODATA value
• • • We do not use the following data for averages, fits, limits, etc. • • •					
939.565420 52±0.00000054		TIESINGA	21	RVUE	2018 CODATA value
939.5654133 ±0.0000058		MOHR	16	RVUE	2014 CODATA value

939.565346 ±0.000023		MOHR	08	RVUE	2006 CODATA value
939.565360 ±0.000081		MOHR	05	RVUE	2002 CODATA value
939.565331 ±0.000037	[1]	KESSLER	99	SPEC	$np \to d\gamma$
939.565330 ±0.000038		MOHR	99	RVUE	1998 CODATA value
939.56565 ±0.00028	[2,3]	DIFILIPPO	94	TRAP	Penning trap
939.56563 ±0.00028		COHEN	87	RVUE	1986 CODATA value
939.56564 ±0.00028	[3,4]	GREENE	86	SPEC	$np \to d\gamma$
939.5731 ±0.0027	[3]	COHEN	73	RVUE	1973 CODATA value

[1] We use the 1998 CODATA u-to-MeV conversion factor (see the heading above) to get this mass in MeV from the much more precisely measured KESSLER 99 value of 1.00866491637 ± 0.00000000082 u.

[2] The mass is known much more precisely in u: m = 1.0086649235 ± 0.0000000023 u. We use the 1986 CODATA conversion factor to get the mass in MeV.

[3] These determinations are not independent of the $m_n - m_p$ measurements below.

[4] The mass is known much more precisely in u: m = 1.008664919 ± 0.000000014 u.

$\overline{n}$ MASS

VALUE (MeV)	*EVTS*	*DOCUMENT ID*		*TECN*	*COMMENT*
939.485±0.051	59	[1] CRESTI	86	HBC	$\overline{p}p \to \overline{n}n$

[1] This is a corrected result (see the erratum). The error is statistical. The maximum systematic error is 0.029 MeV.

$(m_n - m_{\overline{n}})/\, m_n$

A test of CPT invariance. Calculated from the n and $\overline{n}$ masses, above.

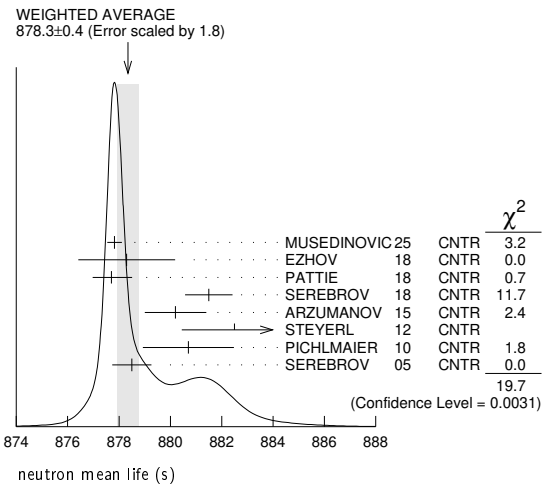
[1] The 2018 CODATA mass difference in u is $m_n - m_p = 1.388\,449\,33(49) \times 10^{-3} u$.

[2] The 2014 CODATA mass difference in u is $m_n - m_p = 1.388\,449\,00(51) \times 10^{-3} u$.

Baryon Particle Listings

n

[3] The 2010 CODATA mass difference in u is $m_n - m_p = 1.388\,449\,19(45) \times 10^{-3} u$.
[4] Calculated by us from the MOHR 08 ratio $m_n/m_p = 1.00137841918(46)$. In u, $m_n - m_p = 1.38844920(46) \times 10^{-3}$ u.
[5] Calculated by us from the MOHR 05 ratio $m_n/m_p = 1.00137841870 \pm 0.00000000058$. In u, $m_n - m_p = (1.3884487 \pm 0.0000006) \times 10^{-3}$ u.
[6] Calculated by us from the MOHR 99 ratio $m_n/m_p = 1.00137841887 \pm 0.00000000058$. In u, $m_n - m_p = (1.3884489 \pm 0.0000006) \times 10^{-3}$ u.
[7] Calculated by us from the COHEN 87 ratio $m_n/m_p = 1.001378404 \pm 0.000000009$. In u, $m_n - m_p = 0.001388434 \pm 0.000000009$ u.



n MEAN LIFE

Limits on lifetimes for *bound* neutrons are given in the section "p PARTIAL MEAN LIVES."

We average eight of the best nine measurements, those made with ultra-cold neutrons (UCN's). If we include the one in-beam measurement with a comparable error (YUE 13), we get 878.6 ± 0.6 s, where the scale factor is now 2.2.

For a recent discussion of the long-standing disagreement between in-beam and UCN results, see CZARNECKI 18 (Physical Review Letters **120** 202002 (2018)). For a full review of all matters concerning the neutron lifetime until about 2010, see WIETFELDT 11, F.E. Wietfeldt and G.L. Greene, "The neutron lifetime," Reviews of Modern Physics **83** 1173 (2011).

[1] MUSEDINOVIC 25 result is the average value of the previously published data of 2018–2019 in GONZALEZ 21 with the new 2020–2022 data. The new data alone yields a value of 877.96 ± 0.37 s. GONZALEZ 21 results are thus superseded.
[2] PATTIE 18 uses a new technique, with a semi-toroidal magneto-gravitational asymmetric trap and a novel in situ n-detector.
[3] ARZUMANOV 15 is a reanalysis of their 2008–2010 dataset, with improved systematic corrections of of ARZUMANOV 00 and ARZUMANOV 12.
[4] STEYERL 12 is a detailed reanalysis of neutron storage loss corrections to the raw data of MAMPE 89, and it replaces that value.
[5] Superseded by MUSEDINOVIC 25.
[6] WILSON 21 extract the value from the flux of n escaping the moon using data from the Lunar Prospector Neutron Spectrometer.
[7] YUE 13 differs from NICO 05 in that a different and better method was used to measure the neutron density in the fiducial volume. This shifted the lifetime by +1.4 seconds and reduced the previously largest source of systematic uncertainty by a factor of five.
[8] ARZUMANOV 12 reanalyzes its systematic corrections in ARZUMANOV 00 and obtains this corrected value.
[9] IGNATOVICH 95 calls into question some of the corrections and averaging procedures used by MAMPE 93. The response, BONDARENKO 96, denies the validity of the criticisms.
[10] The NESVIZHEVSKII 92 measurement has been withdrawn by A. Serebrov.
[11] The BYRNE 80 measurement has been withdrawn (J. Byrne, private communication, 1990).

n MAGNETIC MOMENT

See the "Quark Model" review.

<16	90	ALTAREV	79	MRS	$d = (4.0 \pm 7.5) \times 10^{-25}$

[1] ABEL 20 reports $d = (0.0 \pm 1.1 \pm 0.2) \times 10^{-26}$ $e$cm value corresponding to the listed limit.
[2] SAHOO 17 develops theory to calculate this limit from the measured limit by GRANER 16 of the ^{199}Hg atom EDM.
[3] PENDLEBURY 15 reports $d = (-0.21 \pm 1.82) \times 10^{-26}$ $e$cm value corresponding to the listed limit.
[4] SEREBROV 14 includes the data of ALTAREV 96.
[5] LAMOREAUX 07 faults BAKER 06 for not including in the estimate of systematic error an effect due to the Earth's rotation. BAKER 07 replies (1) that the effect was included implicitly in the analysis and (2) that further analysis confirms that the BAKER 06 limit is correct as is. See also SILENKO 07.
[6] This HARRIS 99 result includes the result of SMITH 90. However, the averaging of the results of these two experiments has been criticized by LAMOREAUX 00.

n MEAN-SQUARE CHARGE RADIUS

The mean-square charge radius of the neutron, $\langle r_n^2 \rangle$, is related to the neutron-electron scattering length b_{ne} by $\langle r_n^2 \rangle = 3(m_e a_0/m_n) b_{ne}$, where m_e and m_n are the masses of the electron and neutron, and a_0 is the Bohr radius. Numerically, $\langle r_n^2 \rangle = 86.34\, b_{ne}$, if we use a_0 for a nucleus with infinite mass.

[1] KOSSERT 03 gets $\alpha_n - \beta_n = (9.8 \pm 3.6^{+2.1}_{-1.1} \pm 2.2) \times 10^{-4}$ fm^3, and uses $\alpha_n + \beta_n = (15.2 \pm 0.5) \times 10^{-4}$ fm^3 from LEVCHUK 00. Thus the errors on α_n and β_n are anti-correlated.
[2] LUNDIN 03 measures $\alpha_N - \beta_N = (6.4 \pm 2.4) \times 10^{-4}$ fm^3 and uses accurate values for α_p and α_p and a precise sum-rule result for $\alpha_n + \beta_n$. The second error is a model uncertainty, and errors on α_n and β_n are anticorrelated. The data from this paper aer included in the analysis of MYERS 14.
[3] KOLB 00 obtains this value with a lower limit of 7.6×10^{-4} fm^3 but no upper limit from this experiment alone. Combined with results of ROSE 90, the 1-σ range is (7.6–14.0) $\times 10^{-4}$ fm^3.
[4] KOESTER 95 uses natural Pb and the isotopes 208, 207, and 206. See this paper for a discussion of methods used by various groups to extract α_n from data.

LIMIT ON $n\overline{n}$ OSCILLATIONS

Mean Time for $n\overline{n}$ Transition

A test of $\Delta B=2$ baryon number nonconservation. MOHAPATRA 80 and MOHAPATRA 89 discuss the theoretical motivations for looking for $n\overline{n}$ oscillations. DOVER 83 and DOVER 85 give phenomenological analyses. The best limits come from looking for the decay of neutrons bound in nuclei. However, these analyses require model-dependent corrections for nuclear effects. See KABIR 83, DOVER 89, ALBERICO 91, and GAL 00 for discussions. Direct searches for $n \to \overline{n}$ transitions using reactor neutrons are cleaner but give somewhat poorer limits. We include limits for both free and bound neutrons in the Summary Table. See MOHAPATRA 09 and PHILLIPS 16 for recent reviews.

[2] The AHARMIM 17 value is an unbounded limit (it does not assume a positive lifetime). The bounded limit is 1.23×10^8 sec.

LIMIT ON nn' OSCILLATIONS

Lee and Yang (LEE 56) proposed the existence of mirror world in an attempt to restore global parity symmetry. A possible candidate for dark matter. Limits depend on assumptions about fields B and B'. See the papers for details. See BEREZHIANI 18 for a recent discussion.

[1] BAN 23 determine limits on the oscillation time for the $\lvert\delta m(nn')\rvert$ range of 2–59 peV. The quoted value is $\tau_{nn'}/\sqrt{cos(\beta)} > 1$ sec. for B in 30–1143 μT, for the case $\beta = 0$.
[2] ALMAZAN 22 reports an experimental constraint on the probability for neutron conversion into a hidden neutron, $p < 3.1 \times 10^{-11}$ at 95% CL, which may be used to set a limit on the nn' oscillation time.
[3] ABEL 21 determine several limits on the oscillation time as a function of the mirror magnetic field B', and of the fixed angle, β, between the applied magnetic field and B'. The latter is assumed to be bound to Earth. Two values are quoted from two analysis methods: (i) $\tau_{nn'}/\sqrt{cos(\beta)} > 9$ sec for B' in 5–25.4 μT, and (ii) for any angle β, $\tau_{nn'} > 6$ sec for B' in 0.4–25.7 μT. The authors also quote a limit of 352 sec for the case $B' = 0$ T.

Baryon Particle Listings

n

[4] The B field was set to (0.09, 0.12, 0.21) G. Limits on oscillation time are valid for any mirror field B' in (0.08–0.17) G, and for aligned fields B and B'. For larger values of B', the limits are significantly reduced.

[5] Losses of neutrons due to oscillations to mirror neutrons would be maximal when the magnetic fields B and B' in the two worlds were equal. Hence the scan over B by ALTAREV 09A: the limit applies for any B' over the given range. At $B' = 0$, the limit is 141 s (95% CL).

n DECAY MODES

See the proton listings for many other neutron decay modes.

	Mode		Fraction (Γ_i/Γ)		Confidence level

not seen	[1] LE-JOUBIOUX	24	SPEC	$^6\text{He} \to {}^4\text{He} + n$
not seen	[2] TANG	18	SPEC	Ultracold n, in NiP-coated bottle

[1] LE-JOUBIOUX 24 search for the baryon number violating decay of n to invisible dark matter candidate, using the $^6\text{He} \to {}^4\text{He} + n + \chi$ reaction, looking for a coincident neutron signal.

[2] TANG 18 search for the baryon number violating decay of n to γ plus an invisible dark matter candidate. They exclude the presence of a monoenergetic γ ray in the E(γ) range 782–1664 keV with branching ratio $\simeq 1\%$ at 97% CL or greater.

See the related review(s):
Baryon Decay Parameters

$n \to p e^- \overline{\nu}_e$ DECAY PARAMETERS

See the above "Note on Baryon Decay Parameters." For discussions of recent results, see the references cited at the beginning of the section on the neutron mean life. For discussions of the values of the weak coupling constants g_A and g_V obtained using the neutron lifetime and asymmetry parameter A, comparisons with other methods of obtaining these constants, and implications for particle physics and for astrophysics, see DUBBERS 91 and WOOLCOCK 91. For tests of the $V-A$ theory of neutron decay, see EROZOLIMSKII 91B, MOSTOVOI 96, NICO 05, SEVERIJNS 06, and ABELE 08.

$\lambda \equiv g_A / g_V$

In the Standard Model $\lambda \equiv g_A/g_V$ is related to parameter a, e-$\overline{\nu}_e$ angular correlation coefficient, by $a = (1 - \lambda^2) / (1 + 3\lambda^2)$; this assumes that g_A and g_V are real. The relationship between a and λ is further modified once recoil corrections are included, see WIETFELDT 24.

[1] WIETFELDT 24 updates HASSAN 21, see footnote to HASSAN 21. The value is extracted from the angular correlation coefficient.

[2] BECK 20 calculates this value from the measurement of the β-decay e–$\overline{\nu}_e$ angular correlation coefficient a.

[3] MAERKISCH 19 gets $A = -0.11985 \pm 0.00017 \pm 0.00012$.

[4] BROWN 18 gets $A = -0.12054 \pm 0.00044 \pm 0.00068$ and $\lambda = -1.2783 \pm 0.0022$. We quote the combined values that include the earlier UCNA measurements (MENDENHALL 13).

[5] This MUND 13 value includes earlier PERKEO II measurements (ABELE 02 and ABELE 97D).

[6] MOSTOVOI 01 measures the two P-odd correlations A and B, or rather SA and SB, where S is the n polarization, in free neutron decay.

[7] YEROZOLIMSKY 97 makes a correction to the EROZOLIMSKII 91 value.

[8] HASSAN 21 include earlier data of DARIUS 17. The value is extracted from the angular correlation coefficient a.

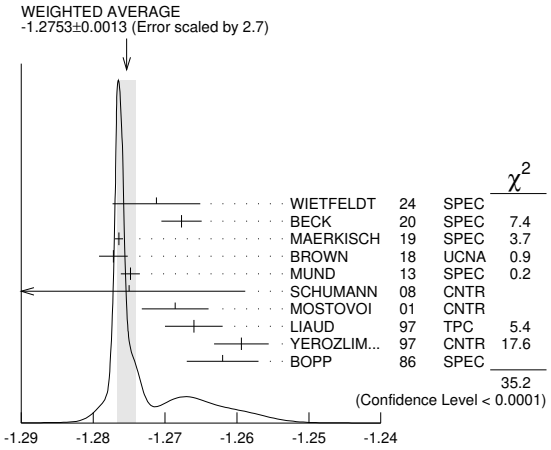
[9] SAUL 20 quote this value of λ under the SM assumption of the Fierz term $b = 0$. In a combined fit authors extract a value of $\lambda = -1.2792 \pm 0.0060$.

[10] DARIUS 17 calculates this value from the measurement of the a parameter (see below). Data is included in HASSAN 21.

[11] MENDENHALL 13 gets $A = -0.11954 \pm 0.00055 \pm 0.00098$ and $\lambda = -1.2756 \pm 0.0030$. We quote the nearly identical values that include the earlier UCNA measurement (PLASTER 12), with a correction to that result.

[12] This PLASTER 12 value is identical with that given in LIU 10, but the experiment is now described in detail.

[13] This is the combined result of ABELE 02 and ABELE 97D.



[14] These experiments measure the absolute value of g_A/g_V only.

[15] KROHN 75 includes events of CHRISTENSEN 70.

[16] KROPF 74 reviews all data through 1972.

e^- ASYMMETRY PARAMETER A

This is the neutron-spin electron-momentum correlation coefficient. The coefficient itself is not well defined in any measurement once higher-order radiative and recoil corrections, which are experiment dependent, are included. By contrast, measurements of the ratio $\lambda \equiv g_A/g_V$ (see data block above) incorporate such higher-order effects. For this reason, and in order to meaningfully compare results from different measurements, we list here the zero-recoil-order A-coefficient, which in the Standard Model and at zero recoil order, is related to $\lambda \equiv g_A/g_V$ by $A = -2\,\lambda\,(\lambda+1)\,/\,(1+3\lambda^2)$; this assumes that g_A and g_V are real. See e.g. MAERKISCH 19 and BROWN 18.

[1] MAERKISCH 19 further derive a value for the CKM-element $|V_{ud}| = 0.97351 \pm 0.00060$, using $\tau_n = 879.7(8)$ sec and the relation from CZARNECKI 18.

[2] BROWN 18 gets $A = -0.12054 \pm 0.00044 \pm 0.00068$ and $\lambda = -1.2783 \pm 0.0022$. We quote the combined values that include the earlier UCNA measurements (MENDENHALL 13).

[3] This MUND 13 value includes earlier PERKEO II measurements (ABELE 02 and ABELE 97D), with a correction to those results.

[4] YEROZOLIMSKY 97 makes a correction to the EROZOLIMSKII 91 value.

[5] Under the SM assumption that the Fierz term $b = 0$, SAUL 20 obtain the quoted asymmetry parameter A and $\lambda = -1.27607 \pm 0.00068$. In a combined fit authors extract the values $A = -0.1209 \pm 0.0015$, $\lambda = -1.2792 \pm 0.0060$, and $b = 0.017 \pm 0.021$.

[6] MENDENHALL 13 gets $A = -0.11954 \pm 0.00055 \pm 0.00098$ and $\lambda = -1.2756 \pm 0.0030$. We quote the nearly identical values that include the earlier UCNA measurement (PLASTER 12), with a correction to that result.

[7] This PLASTER 12 value is identical with that given in LIU 10, but the experiment is now described in detail.

[8] This is the combined result of ABELE 02 and ABELE 97D.

[9] MOSTOVOI 01 calculates this from its measurement of $\lambda = g_A/g_V$ above.

[10] These results are not corrected for radiative effects and weak magnetism, but the corrections are small compared to the errors.

$\overline{\nu}_e$ ASYMMETRY PARAMETER B

This is the neutron-spin antineutrino-momentum correlation coefficient. In the Standard Model, B is related to $\lambda \equiv g_A/g_V$ by $B = 2\lambda(\lambda-1)\,/\,(1+3\lambda^2)$; this assumes that g_A and g_V are real.

e-$\overline{\nu}_e$ ANGULAR CORRELATION COEFFICIENT a_0

For a review of past measurements of the a-coefficient, see WIETFELDT 05. The a-coefficient itself is not well defined in any measurement once higher-order radiative and recoil corrections, which are experiment dependent, are included. By contrast, measurements of the ratio $\lambda \equiv g_A/g_V$ (see data block above) incorporate such higher-order effects. For this reason, and in order to meaningfully compare results for the angular correlation coefficient from measurements of different observables, we list here the zero-recoil-order a-coefficient, denoted a_0, which in the Standard Model and at zero recoil order, is related to λ by $a_0 = (1-\lambda^2)\,/\,(1+3\lambda^2)$; this assumes that g_A and g_V are real. See also the discussion in WIETFELDT 24.

[1] WIETFELDT 24 updates HASSAN 21. Includes radiative and recoil corrections to first order, and is averaged over the full Fermi neutron beta spectrum. Supersedes HASSAN 21.

[2] HASSAN 21 includes the data of DARIUS 17. Uses the asymmetry in time-of-flight between the beta electron and recoil proton in delayed coincidence. Supersedes DARIUS 17.

[3] DARIUS 17 exploits a "wishbone" correlation, where the p time of flight is correlated with the momentum of the electron in delayed coincidence. Data is included in HASSAN 21.

[4] MOSTOVOI 01 calculates this from its measurement of $\lambda = g_A/g_V$ above.

ϕ_{AV}, PHASE OF g_A RELATIVE TO g_V

Time reversal invariance requires this to be 0 or 180°. This is related to D given in the next data block and $\lambda \equiv g_A/g_V$ by $\sin(\phi_{AV}) \equiv D(1+3\lambda^2)/2|\lambda|$; this assumes that g_A and g_V are real.

Int. J. Mod. Phys. A 2026.41. Downloaded from www.worldscientific.com
by KARLSRUHE INSTITUTE OF TECHNOLOGY on 10/26/26. Re-use and distribution is strictly not permitted, except for Open Access articles.

Baryon Particle Listings

n

TRIPLE CORRELATION COEFFICIENT D

These are measurements of the component of n spin perpendicular to the decay plane in β decay. Should be zero if T invariance is not violated.

VALUE (units 10^{-4})	DOCUMENT ID		TECN	COMMENT
− 1.2 ± 2.0 OUR AVERAGE				
− 0.94± 1.89±0.97	CHUPP	12	CNTR	Cold n, polarized > 91%
− 2.8 ± 6.4 ±3.0	SOLDNER	04	CNTR	Cold n, polarized
− 6 ±12 ±5	LISING	00	CNTR	Polarized > 93%
• • • We do not use the following data for averages, fits, limits, etc. • • •				
− 0.96± 1.89±1.01	MUMM	11	CNTR	See CHUPP 12
+22 ±30	EROZOLIM...	78	CNTR	Cold n, polarized
−27 ±50	[1] EROZOLIM...	74	CNTR	Cold n, polarized
−11 ±17	STEINBERG	74	CNTR	Cold n, polarized

[1] EROZOLIMSKII 78 says asymmetric proton losses and nonuniform beam polarization may give a systematic error up to 30×10^{-4}, thus increasing the EROZOLIMSKII 74 error to 50×10^{-4}. STEINBERG 74 and STEINBERG 76 estimate these systematic errors to be insignificant in their experiment.

TRIPLE CORRELATION COEFFICIENT R

Another test of time-reversal invariance. R measures the polarization of the electron in the direction perpendicular to the plane defined by the neutron spin and the electron momentum. $R = 0$ for T invariance.

VALUE	DOCUMENT ID		TECN	COMMENT
+0.004±0.012±0.005	[1] KOZELA	12	CNTR	Mott polarimeter
• • • We do not use the following data for averages, fits, limits, etc. • • •				
+0.008±0.015±0.005	KOZELA	09	CNTR	See KOZELA 12

[1] KOZELA 12 also measures the polarization of the electron along the direction of the neutron spin. This is nonzero in the Standard Model; the correlation coefficient is $N = +0.067 \pm 0.011 \pm 0.004$.

FIERZ INTERFERENCE TERM b

The coefficient of the Fierz interference term, b, probes additional contributions to the differential decay rate of the neutron from scalar or tensor current interactions, beyond the Standard Model.

VALUE	DOCUMENT ID		TECN	COMMENT
0.017±0.020±0.003	[1] SAUL	20	SPEC	Cold n, polarized

[1] In a combined fit SAUL 20 extract this best fit value of the Fierz interference term b and the values $A = -0.1209 \pm 0.0015$ and $\lambda = -1.2792 \pm 0.0060$. For b it translates into a 90% CL region of $-0.018 \leq b \leq 0.052$ as a function of A.

n REFERENCES

We have omitted some papers that have been superseded by later experiments. See our earlier editions.

$N(1440)$ DECAY MODES

The following branching fractions are our estimates, not fits or averages.

	Mode	Fraction (Γ_j/Γ)
Γ_1	$N\pi$	55–75 %
Γ_2	$N\eta$	< 1 %
Γ_3	$N\pi\pi$	17–50 %
Γ_4	$\Delta(1232)\pi$	6–27 %
Γ_5	$N\rho$	(18±6) %
Γ_6	$N\rho$, S=1/2	(9±4) %
Γ_7	$N\rho$, S=3/2	(9±4) %
Γ_8	$N\sigma$	11–23 %
Γ_9	$p\gamma$, helicity=1/2	0.035–0.048 %
Γ_{10}	$n\gamma$, helicity=1/2	0.02–0.04 %

$N(1520)$

Int. J. Mod. Phys. A 2026.41. Downloaded from www.worldscientific.com
by KARLSRUHE INSTITUTE OF TECHNOLOGY on 10/26/26. Re-use and distribution is strictly not permitted, except for Open Access articles.

$N(1520)$ DECAY MODES

The following branching fractions are our estimates, not fits or averages.

	Mode	Fraction (Γ_i/Γ)
Γ_1	$N\pi$	55–65 %
Γ_2	$N\eta$	0.07–0.09 %
Γ_3	$N\pi\pi$	25–35 %
Γ_4	$\Delta(1232)\pi$	22–34 %
Γ_5	$\Delta(1232)\pi$, S-wave	15–23 %
Γ_6	$\Delta(1232)\pi$, D-wave	7–11 %
Γ_7	$N\rho$	10–16 %
Γ_8	$N\rho$, $S=1/2$	0.2–0.4 %
Γ_9	$N\rho$, $S=3/2$, S-wave	10–16 %
Γ_{10}	$N\rho$, $S=3/2$, D-wave	<1 %
Γ_{11}	$N\sigma$	<10 %
Γ_{12}	$N(1440)\pi$	
Γ_{13}	$p\gamma$	0.31–0.52 %
Γ_{14}	$p\gamma$, helicity=1/2	0.01–0.02 %
Γ_{15}	$p\gamma$, helicity=3/2	0.30–0.50 %
Γ_{16}	$n\gamma$	0.30–0.53 %
Γ_{17}	$n\gamma$, helicity=1/2	0.04–0.10 %
Γ_{18}	$n\gamma$, helicity=3/2	0.25–0.45 %

$N(1650)$ DECAY MODES

The following branching fractions are our estimates, not fits or averages.

	Mode	Fraction (Γ_i/Γ)
Γ_1	$N\pi$	50–70 %
Γ_2	$N\eta$	15–35 %
Γ_3	ΛK	5–15 %
Γ_4	$N\pi\pi$	20–58 %
Γ_5	$\Delta(1232)\pi$	6–18 %
Γ_6	$N\rho$	12–22 %
Γ_7	$N\rho$, S=1/2	<4 %
Γ_8	$N\rho$, S=3/2	12–18 %
Γ_9	$N\sigma$	2–18 %
Γ_{10}	$N(1440)\pi$	6–26 %
Γ_{11}	$p\gamma$, helicity=1/2	0.04–0.20 %
Γ_{12}	$n\gamma$, helicity=1/2	0.003–0.17 %

N(1675) DECAY MODES

The following branching fractions are our estimates, not fits or averages.

	Mode	Fraction (Γ_i/Γ)
Γ_1	$N\pi$	38–42 %
Γ_2	$N\eta$	< 1 %
Γ_3	ΛK	<0.04 %
Γ_4	$N\pi\pi$	25–45 %
Γ_5	$\Delta(1232)\pi$	(19±4) %
Γ_6	$\Delta(1232)\pi$, D-wave	23–37 %
Γ_7	$N\rho$	0.1–0.9 %
Γ_8	$N\rho$, S=1/2	<0.2 %
Γ_9	$N\rho$, S=3/2 , D-wave	0.1–0.7 %
Γ_{10}	$N\sigma$	3–7 %
Γ_{11}	$p\gamma$	0–0.02 %
Γ_{12}	$p\gamma$, helicity=1/2	0–0.01 %
Γ_{13}	$p\gamma$, helicity=3/2	0–0.01 %
Γ_{14}	$n\gamma$	0–0.15 %
Γ_{15}	$n\gamma$, helicity=1/2	0–0.05 %
Γ_{16}	$n\gamma$, helicity=3/2	0–0.10 %

$N(1700)$ DECAY MODES

The following branching fractions are our estimates, not fits or averages.

	Mode	Fraction (Γ_i/Γ)
Γ_1	$N\pi$	7–17 %
Γ_2	$N\eta$	1–2 %
Γ_3	$N\omega$	10–34 %
Γ_4	ΛK	1–2 %
Γ_5	$N\pi\pi$	>89 %
Γ_6	$\Delta(1232)\pi$	55–85 %
Γ_7	$\Delta(1232)\pi$, S-wave	50–80 %
Γ_8	$\Delta(1232)\pi$, D-wave	4–14 %
Γ_9	$N\rho$	(21 ±9) %
Γ_{10}	$N\rho$, S=1/2	(5.0±3.0) %
Γ_{11}	$N\rho$, S=3/2 , S-wave	32–44 %
Γ_{12}	$N\rho$, S=3/2 , D-wave	(16 ±8) %
Γ_{13}	$N\sigma$	2–14 %
Γ_{14}	$N(1440)\pi$	3–11 %
Γ_{15}	$N(1520)\pi$	<4 %
Γ_{16}	$N(1535)\pi$	< 1 %
Γ_{17}	$p\gamma$	0.01–0.05 %
Γ_{18}	$p\gamma$, helicity=1/2	0.0–0.024 %
Γ_{19}	$p\gamma$, helicity=3/2	0.002–0.026 %
Γ_{20}	$n\gamma$	0.01–0.13 %
Γ_{21}	$n\gamma$, helicity=1/2	0.0–0.09 %
Γ_{22}	$n\gamma$, helicity=3/2	0.01–0.05 %

N(1710) DECAY MODES

The following branching fractions are our estimates, not fits or averages.

	Mode	Fraction (Γ_i/Γ)
Γ_1	$N\pi$	5–20 %
Γ_2	$N\eta$	10–50 %
Γ_3	$N\omega$	1–5 %
Γ_4	ΛK	5–25 %
Γ_5	ΣK	seen
Γ_6	$N\pi\pi$	14–48 %
Γ_7	$\Delta(1232)\pi$	3–9 %
Γ_8	$N\rho$	(17 ± 4) %
Γ_9	$N\rho$, S=1/2	11–23 %
Γ_{10}	$N\rho$, S=3/2	(11.0 ± 3.0) %
Γ_{11}	$N\sigma$	<16 %
Γ_{12}	$N(1440)\pi$	(22 ±12) %
Γ_{13}	$N(1520)\pi$	< 2 %
Γ_{14}	$N(1535)\pi$	9–21 %
Γ_{15}	$p\gamma$, helicity=1/2	0.002–0.08 %
Γ_{16}	$n\gamma$, helicity=1/2	0.0–0.02%

N(1720) DECAY MODES

The following branching fractions are our estimates, not fits or averages.

	Mode	Fraction (Γ_i/Γ)
Γ_1	$N\pi$	8–14 %
Γ_2	$N\eta$	1–5 %
Γ_3	$N\omega$	12–40 %
Γ_4	ΛK	4–19 %
Γ_5	$N\pi\pi$	>50 %
Γ_6	$\Delta(1232)\pi$	47–89 %
Γ_7	$\Delta(1232)\pi$, P-wave	47–77 %
Γ_8	$\Delta(1232)\pi$, F-wave	<12 %
Γ_9	$N\rho$	(29 ±8) %
Γ_{10}	$N\rho$, S=1/2	1–2 %
Γ_{11}	$N\rho$, S=3/2 , P-wave	(17 ±6) %
Γ_{12}	$N\sigma$	2–14 %
Γ_{13}	$N(1440)\pi$	<2 %
Γ_{14}	$N(1520)\pi$, S-wave	1–5 %
Γ_{15}	$N(1535)\pi$	(4.0±2.0) %
Γ_{16}	$p\gamma$	0.05–0.25 %
Γ_{17}	$p\gamma$, helicity=1/2	0.05–0.15 %
Γ_{18}	$p\gamma$, helicity=3/2	0.002–0.16 %
Γ_{19}	$n\gamma$	0.0–0.016 %
Γ_{20}	$n\gamma$, helicity=1/2	0.0–0.01 %
Γ_{21}	$n\gamma$, helicity=3/2	0.0–0.015 %

$N(1860)\ 5/2^+$

$I(J^P) = \frac{1}{2}(\frac{5}{2}^+)$ Status: **

OMITTED FROM SUMMARY TABLE

Before the 2012 *Review*, all the evidence for a $J^P = 5/2^+$ state with a mass above 1800 MeV was filed under a two-star $N(2000)$. There is now some evidence from ANISOVICH 12A for two $5/2^+$ states in this region, so we have split the older data (according to mass) between two two-star $5/2^+$ states, an $N(1860)$ and an $N(2000)$.

$N(1895)$ $1/2^-$

$I(J^P) = \frac{1}{2}(\frac{1}{2}^-)$ Status: ****

was $N(2090)$

Before our 2012 *Review*, this state appeared in our Listings as the $N(2090)$. Any structure in the S_{11} wave above 1800 MeV is listed here. A few early results that are now obsolete have been omitted.

$N(2000)\ 5/2^+$

$I(J^P) = \frac{1}{2}(\frac{5}{2}^+)$ Status: **

OMITTED FROM SUMMARY TABLE
was $N(1900)$

Before the 2012 *Review*, all the evidence for a $J^P = 5/2^+$ state with a mass above 1800 MeV was filed under a two-star $N(2000)$. There is now some evidence from ANISOVICH 12A for two $5/2^+$ states in this region, so we have split the older data (according to mass) between two two-star $5/2^+$ states, an $N(1860)$ and an $N(2000)$.

$N(2120)$ $3/2^-$

$I(J^P) = \frac{1}{2}(\frac{3}{2}^-)$ Status: ***

Before the 2012 *Review*, all the evidence for a $J^P = 3/2^-$ state with a mass above 1800 MeV was filed under a two-star $N(2080)$. There is now evidence from ANISOVICH 12A for two $3/2^-$ states in this region, so we have split the older data (according to mass) between a three-star $N(1875)$ and a two-star $N(2120)$.

$N(2190)$ DECAY MODES

The following branching fractions are our estimates, not fits or averages.

	Mode	Fraction (Γ_i/Γ)
Γ_1	$N\pi$	10–20 %
Γ_2	$N\eta$	1–5 %
Γ_3	$N\omega$	8–20 %
Γ_4	ΛK	0.2–0.8 %
Γ_5	$N\pi\pi$	22–51 %
Γ_6	$\Delta\pi$	(4.0 ± 2.0) %
Γ_7	$\Delta(1232)\pi$, D-wave	19–31 %
Γ_8	$N\rho$	(8 ±7) %
Γ_9	$N\rho$, S=3/2, D-wave	<11 %
Γ_{10}	$N\sigma$	3–9 %
Γ_{11}	$\Lambda K^*(892)$	0.2–0.8 %
Γ_{12}	$p\gamma$	<0.08 %
Γ_{13}	$p\gamma$, helicity=1/2	<0.06 %
Γ_{14}	$p\gamma$, helicity=3/2	<0.02 %
Γ_{15}	$n\gamma$	<0.04 %
Γ_{16}	$n\gamma$, helicity=1/2	<0.01 %
Γ_{17}	$n\gamma$, helicity=3/2	<0.03 %

$N(\sim 3000$ Region) Partial-Wave Analyses

OMITTED FROM SUMMARY TABLE

We list here miscellaneous high-mass candidates for isospin-1/2 resonances found in partial-wave analyses.

Our 1982 edition had an $N(3245)$, an $N(3690)$, and an $N(3755)$, each a narrow peak seen in a production experiment. Since nothing has been heard from them since the 1960's, we declare them to be dead. There was also an $N(3030)$, deduced from total cross-section and 180° elastic cross-section measurements; it is the KOCH 80 $L_{1,15}$ state below.

Δ(1700) DECAY MODES

The following branching fractions are our estimates, not fits or averages.

	Mode	Fraction (Γ_i/Γ)
Γ_1	$N\pi$	10–20 %
Γ_2	$N\pi\pi$	>31 %
Γ_3	$\Delta(1232)\pi$	9–70 %
Γ_4	$\Delta(1232)\pi$, S-wave	5–54 %
Γ_5	$\Delta(1232)\pi$, D-wave	4–16 %
Γ_6	$N\rho$	(15 ±4) %
Γ_7	$N\rho$, S=3/2, S-wave	22–32%
Γ_8	$N(1440)\pi$	(3.0±2.0) %
Γ_9	$N(1520)\pi$, P-wave	1–5 %
Γ_{10}	$N(1535)\pi$	0.5–1.5 %
Γ_{11}	$\Delta(1232)\eta$	3–7 %
Γ_{12}	$N\gamma$	0.22–0.60 %
Γ_{13}	$N\gamma$, helicity=1/2	0.12–0.30 %
Γ_{14}	$N\gamma$, helicity=3/2	0.10–0.30 %

Δ(1905) DECAY MODES

The following branching fractions are our estimates, not fits or averages.

	Mode	Fraction (Γ_i/Γ)
Γ_1	$N\pi$	9–15%
Γ_2	$N\pi\pi$	>65%
Γ_3	$\Delta(1232)\pi$	>48%
Γ_4	$\Delta(1232)\pi$, P-wave	8–43%
Γ_5	$\Delta(1232)\pi$, F-wave	40–58%
Γ_6	$N\rho$	(25±10) %
Γ_7	$N\rho$, S=3/2, P-wave	17–35%
Γ_8	$N(1535)\pi$	< 1 %
Γ_9	$N(1680)\pi$, P-wave	5–15%
Γ_{10}	$\Delta(1232)\eta$	2–6%
Γ_{11}	$N\gamma$	0.012–0.036 %
Γ_{12}	$N\gamma$, helicity=1/2	0.002–0.006 %
Γ_{13}	$N\gamma$, helicity=3/2	0.01–0.03 %

$\Delta(1950)$ DECAY MODES

The following branching fractions are our estimates, not fits or averages.

	Mode	Fraction (Γ_i/Γ)
Γ_1	$N\pi$	35–45 %
Γ_2	ΣK	0.3–0.5 %
Γ_3	$N\pi\pi$	37–77 %
Γ_4	$\Delta(1232)\pi$	(4.0±3.0) %
Γ_5	$\Delta(1232)\pi$, F-wave	1–9 %
Γ_6	$N\rho$	(10 ±5) %
Γ_7	$N\rho$, S=1/2	(10 ±5) %
Γ_8	$N(1680)\pi$, P-wave	3–9 %
Γ_9	$\Delta(1232)\eta$	< 0.6 %
Γ_{10}	$N\gamma$	0.06–0.14 %
Γ_{11}	$N\gamma$, helicity=1/2	0.03–0.05 %
Γ_{12}	$N\gamma$, helicity=3/2	0.04–0.09 %

$\Delta(\sim 3000$ Region) Partial-Wave Analyses

OMITTED FROM SUMMARY TABLE

We list here miscellaneous high-mass candidates for isospin-3/2 resonances found in partial-wave analyses.

Our 1982 edition also had a $\Delta(2850)$ and a $\Delta(3230)$. The evidence for them was deduced from total cross-section and 180° elastic cross-section measurements. The $\Delta(2850)$ has been resolved into the $\Delta(2750)$ $I_{3,13}$ and $\Delta(2950)$ $K_{3,15}$. The $\Delta(3230)$ is perhaps related to the $K_{3,13}$ of HENDRY 78 and to the $L_{3,17}$ of KOCH 80.

$\Delta(\sim 3000)$ BREIT-WIGNER MASS

[1] We assume CPT invariance: this is the $\overline{\Lambda}$ mass as measured by HARTOUNI 94. See below for the fractional mass difference, testing CPT.

[2] The SCHMIDT 65 masses have been reevaluated using our April 1973 proton and $K^\pm$ and $\pi^\pm$ masses. P. Schmidt, private communication (1974).

[3] The mass has been raised 35 keV to take into account a 46 keV increase in the proton mass and an 11 keV decrease in the $\pi^\pm$ mass (note added Reviews of Modern Physics **39** 1 (1967)).

Baryon Particle Listings

Λ

CONSTRAINED FIT INFORMATION

An overall fit to 4 branching ratios uses 11 measurements and one constraint to determine 3 parameters. The overall fit has a $\chi^2 = 6.9$ for 9 degrees of freedom.

The following *off-diagonal* array elements are the correlation coefficients $\langle \delta x_i \delta x_j \rangle / (\delta x_i \cdot \delta x_j)$, in percent, from the fit to the branching fractions, $x_i \equiv \Gamma_i/\Gamma_{\text{total}}$. The fit constrains the x_i whose labels appear in this array to sum to one.

Limit on $\overline{\Lambda}\Lambda$ oscillations

Upper limit for the oscillation rate of ($\overline{\Lambda} \to \Lambda$) hyperons. A test of baryon number nonconservation. We quote the oscillation parameter $\delta m_{\overline{\Lambda}\Lambda}$, deduced from the oscillation rate $P(\Lambda)$ and the hyperon lifetime τ_Λ, as $(\delta m_{\overline{\Lambda}\Lambda})^2 = P(\Lambda) / 2\tau_\Lambda^2$.

[1] LI 23C quote the average Λ-hyperon asymmetry A_{CP}^{α} from 264k $\Lambda_c^+ \to \Lambda\pi^+$ decays and 105k $\Lambda_c^+ \to \Sigma^0\pi^+$ decays, under the assumption of no CP violation in the SM for Λ_c^+, i.e. $\alpha_{\Lambda_c^+} = -\alpha_{\overline{\Lambda}_c^-}$.

[2] CHAUVAT 85 actually gives $\alpha_+(\overline{\Lambda})/\alpha_-(\Lambda) = -1.04 \pm 0.29$. Assumes polarization is same in $\overline{p}p \to \overline{\Lambda}X$ and $pp \to \Lambda X$. Tests of this assumption, based on C-invariance and fragmentation, are satisfied by the data.

[3] Superseded by ABLIKIM 22AG.

Baryon Particle Listings

Λ, Λ's and Σ's, $\Lambda(1380)$, $\Lambda(1405)$

g_A / g_V FOR $\Lambda \to p e^- \overline{\nu}_e$

Measurements with fewer than 500 events have been omitted. Where necessary, signs have been changed to agree with our conventions, which are given in the "Note on Baryon Decay Parameters" in the neutron Listings. The measurements all assume that the form factor $g_2 = 0$. See also the footnote on DWORKIN 90.

[1] The tabulated result assumes the weak-magnetism coupling $w \equiv g_W(0)/g_V(0)$ to be 0.97, as given by the CVC hypothesis and as assumed by the other listed measurements. However, DWORKIN 90 *measures* w to be 0.15 ± 0.30, and then $g_A/g_V = -0.731 \pm 0.016$.

[2] This experiment measures only the absolute value of g_A/g_V.

$\Lambda(1405)\ 1/2^-$

$I(J^P) = 0(\frac{1}{2}^-)$ Status: ****

In the 1998 Note on the $\Lambda(1405)$ in PDG 98, R.H. Dalitz discussed the S-shaped cusp behavior of the intensity at the N-$\overline{K}$ threshold observed in THOMAS 73 and HEMINGWAY 85. He commented that this behavior "is characteristic of S-wave coupling; the other below threshold hyperon, the $\Sigma(1385)$, has no such threshold distortion because its N-$\overline{K}$ coupling is P-wave. For $\Lambda(1405)$ this asymmetry is the sole direct evidence that $J^P = 1/2^-$."

A recent measurement by the CLAS collaboration, MORIYA 14, definitively established the long-assumed $J^P = 1/2^-$ spin-parity assignment of the $\Lambda(1405)$. The experiment produced the $\Lambda(1405)$ spin-polarized in the photoproduction process $\gamma p \to K^+\Lambda(1405)$ and measured the decay of the $\Lambda(1405)$(polarized) $\to \Sigma^+$(polarized)π^-. The observed isotropic decay of $\Lambda(1405)$ is consistent with spin $J = 1/2$. The polarization transfer to the Σ^+(polarized) direction revealed negative parity, and thus established $J^P = 1/2^-$.

Λ(1520) 3/2⁻

$I(J^P) = 0(\frac{3}{2}^-)$ Status: ****

Discovered by FERRO-LUZZI 62; the elaboration in WATSON 63 is the classic paper on the Breit-Wigner analysis of a multichannel resonance.

The measurements of the mass, width, and elasticity published before 1975 are now obsolete and have been omitted. They were last listed in our 1982 edition Physics Letters **111B** 1 (1982).

Production and formation experiments agree quite well, so they are listed together here.

$\Gamma(\Sigma(1385)\pi(\to \Lambda\pi\pi))/\Gamma(\Lambda\pi\pi)$ Γ_7/Γ_3

The $\Lambda\pi\pi$ mode is largely due to $\Sigma(1385)\pi$. Only the values of $(\Sigma(1385)\pi)\ /\ (\Lambda 2\pi)$ given by MAST 73B and CORDEN 75 are based on real 3-body partial-wave analyses. The discrepancy between the two results is essentially due to the different hypotheses made concerning the shape of the $(\pi\pi)_{S\text{-wave}}$ state.

Λ(1820) 5/2+

$I(J^P) = 0(\frac{5}{2}^+)$ Status: ****

This resonance is the cornerstone for all partial-wave analyses in this region. Most of the results published before 1973 are now obsolete and have been omitted. They may be found in our 1982 edition Physics Letters **111B** 1 (1982).
