Global intercomparison of SCIAMACHY XCH₄ with NDACC FTS – what can we learn for GOSAT validation by TCCON FTS?

R. Sussmann, M. Rettinger, F. Forster, T. Borsdorff

Outline:

- global intercomp. of SCIA XCH₄ versus 12 NDACC MIR-FTIR stations
- first GFIT results from nearly 2 years TCCON operations at Garmisch
- annual cycles: SCIA versus g.-b. MIR versus g.-b. NIR
- diurnal variations: g.-b. MIR versus g.-b. NIR
- summary

Research Center Karlsruhe, IMK-IFU Garmisch-Partenkirchen

Sussmann et al.: *Validation of SCIA & GOSAT XCH₄ by NDACC & TCCON FTS*

Conclusions from ACP (2005)*: SCIA WFMD v0.41 versus Zugspitze MIR-FTIR

Zugspitze FTIR:

- precision of daily means is $\approx 0.4\%$
- \Rightarrow can retrieve true annual-cycle amplitude: $\approx 1\%$
- \Rightarrow can retrieve true day-to-day variability: $\approx 1\%$

SCIAMACHY WFMD v0.41:

- time-dependent biases $\approx 3\%$ /month due to icing problems in channel 8
- \Rightarrow could not retrieve true day-to-day variability
- “precision of the daily means $\approx 0.6\%$ (calculated from the individual pixels, 1000-km selection radius) **would be sufficient to capture true day-to-day variability and the annual cycle - if the icing issue could be eliminated**”.

SCIAMACHY nadir spectrum & fitting windows

New questions for validating SCIA **IMAP-DOAS v49** & **WFM-DOAS v1.0**

After validation in 2005, the SCIAMACHY icing issue was overcome by re-implementing SCIA retrievals from channel 8 to channel 6.

Two years of SCIA data are now available: 2003 & 2004.

⇒ **Possible to revisit the questions**

1: Can the new SCIA channel 6 retrievals capture true day-to-day variability?

2: Can the new SCIA retrievals reflect annual cycles as seen by FTIR?

3: Is there a latitudinal dependency of biases for IMAP-DOAS v49 and WFM-DOAS v1.0?

⇒ **Make sure that g.-b. CH₄ columns are retrieved in a perfectly consistent manner at all globally distributed ground-based MIR-FTIR stations.**

The 12 NDACC-MIR-FTIR stations of our SCIA – MIR-FTIR intercomp. study

station	latitude	longitude	station altitude	Number of columns in 2003/2004	tropopause height
Spitzbergen	78.92 N	11.92 E	20 m	113	8.95 km
Thule	76.53 N	68.74 W	225 m	177	8.51 km
Kiruna	67.84 N	20.41 E	419 m	338	9.62 km
Harestua	60.22 N	10.75 E	596 m	1234	10.20 km
Bremen	53.11 N	8.85 E	29 m	179	10.74 km
Zugspitze	47.42 N	10.98 E	2964 m	999	11.25 km
Garmisch	47.48 N	11.06 E	745 m	498	11.25 km
Jungfrauoch	46.55 N	7.99 E	3580 m	702	11.38 km
Toronto	43.66 N	79.40 W	174 m	185	13.25 km
Izaña	28.30 N	16.48 W	2367 m	207	14.44 km
St-Denis	20.90 S	55.48 E	50 m	141	15.66 km

Sussmann et al.: *Validation of SCIA & GOSAT XCH₄ by NDACC & TCCON FTS*

MIR-FTIR CH₄ retrieval homogenization:

👍 one common micro-window set: 5 windows 2613 - 2921 cm⁻¹

- 👍 harmonized treatment of interfering species: same bininput-file
- 👍 identical spectroscopy for all: same cfgls (HIT04 & Hase update)
- 👍 common source of pT-input profiles: NCEP
- 👍 one consistent set of a priori profiles: Toon with Meier correction
- 👍 one consistent set of regularization matrices and altitude grids: Tikhonov-L₁ on the %-VMR scale

Research Center Karlsruhe, IMK-IFU Garmisch-Partenkirchen

Sussmann et al.: *Validation of SCIA & GOSAT XCH₄ by NDACC & TCCON FTS*

Harmonizing the g.-b. MIR XCH₄ data set: [how to calculate the air column](#)

- in situ p measurements not continuously available at all sites for 2003/2004
- radio sondes not available for all sites
- NEP p-profiles and ECMWF in situ p available
- NCEP favored because:
 - The forward model of the g.-b. FTIR retrievals uses NCEP pressure profiles to calculate the airmass-profile (“fas.mas” file) which is internally used to transfer VMR profiles to partial column (CH₄) profiles
 - I.e., the air columns calculated from NCEP are i) readily available, and ii) perfectly consistent to the CH₄ total columns retrieved.

Harmonizing the g.-b. MIR XCH₄ validation data set: **dry versus wet XCH₄**

- previous SCIA validation studies derived XCH₄ from FTIR via rationing by wet air columns (derived from pressure data).

⇒ inconsistency to SCIAMACHY, which retrieves dry XCH₄ .

⇒ FTIRs should subtract the water vapor column from the air column:

where do we get water columns from?

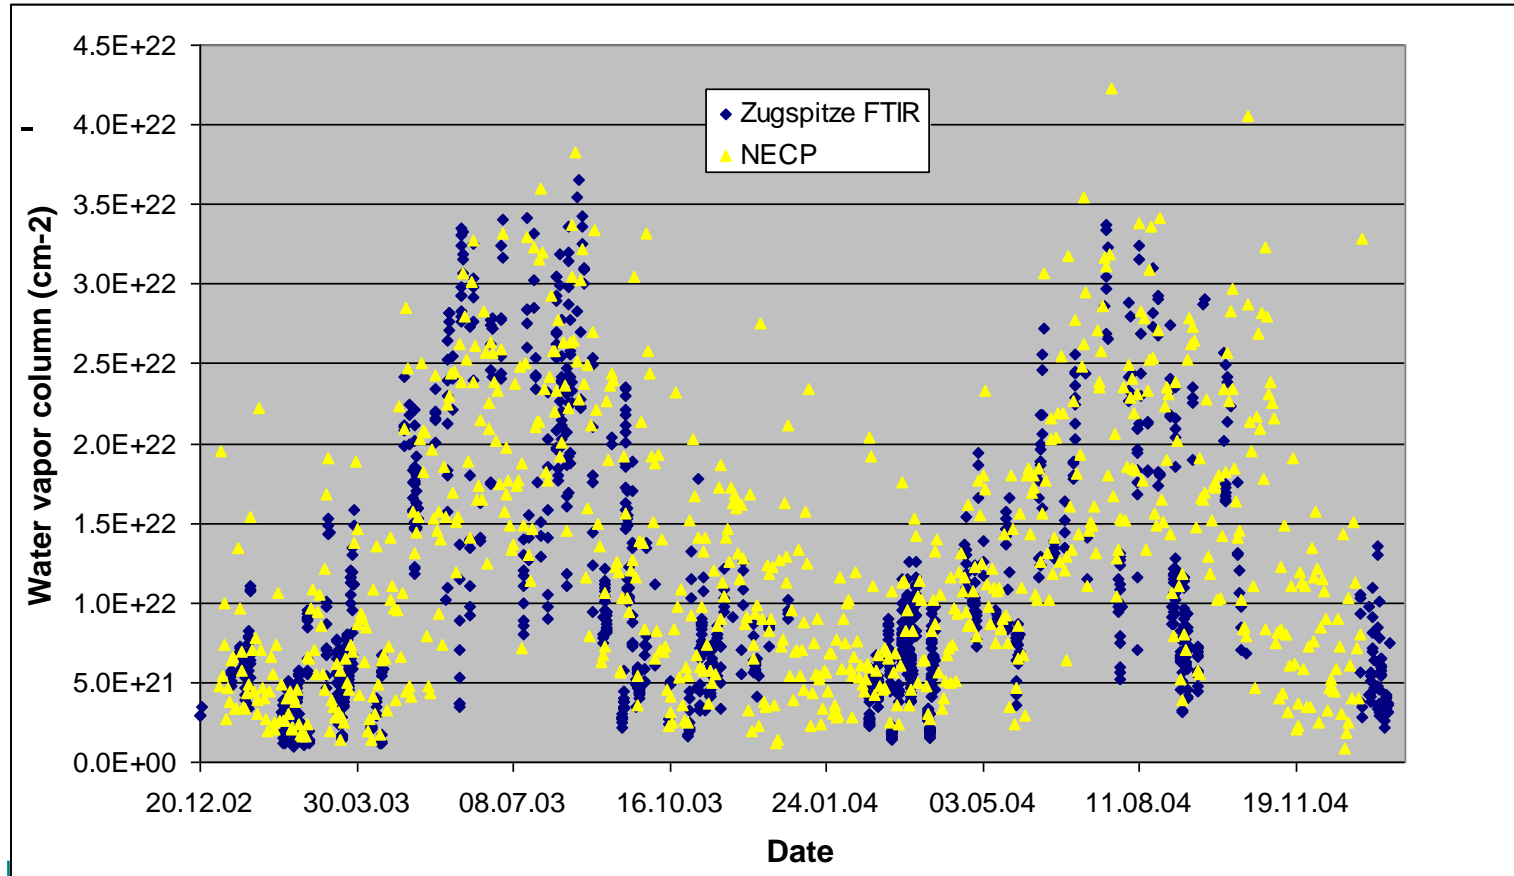

not all FTIR groups have a matured FTIR water retrieval;

are NCEP water columns reliable?

Harmonizing the g.-b. MIR XCH₄ validation data set: how to calculate dry XCH₄

validate NCEP water columns
against

Annual cycles: airmass-dependent artifacts – taken from Geoff’s 2006 talk

Retrievals of gases known to have tiny diurnal variations, e.g. O_2 , CO_2 (winter), CH_4 , N_2O , often exhibit airmass-dependent artifacts.

These are often termed a “smile” (column increases with airmass) or a “frown” (column decreases with airmass) due to their shape when plotted versus time of day.

Geoff’s 2006 talk

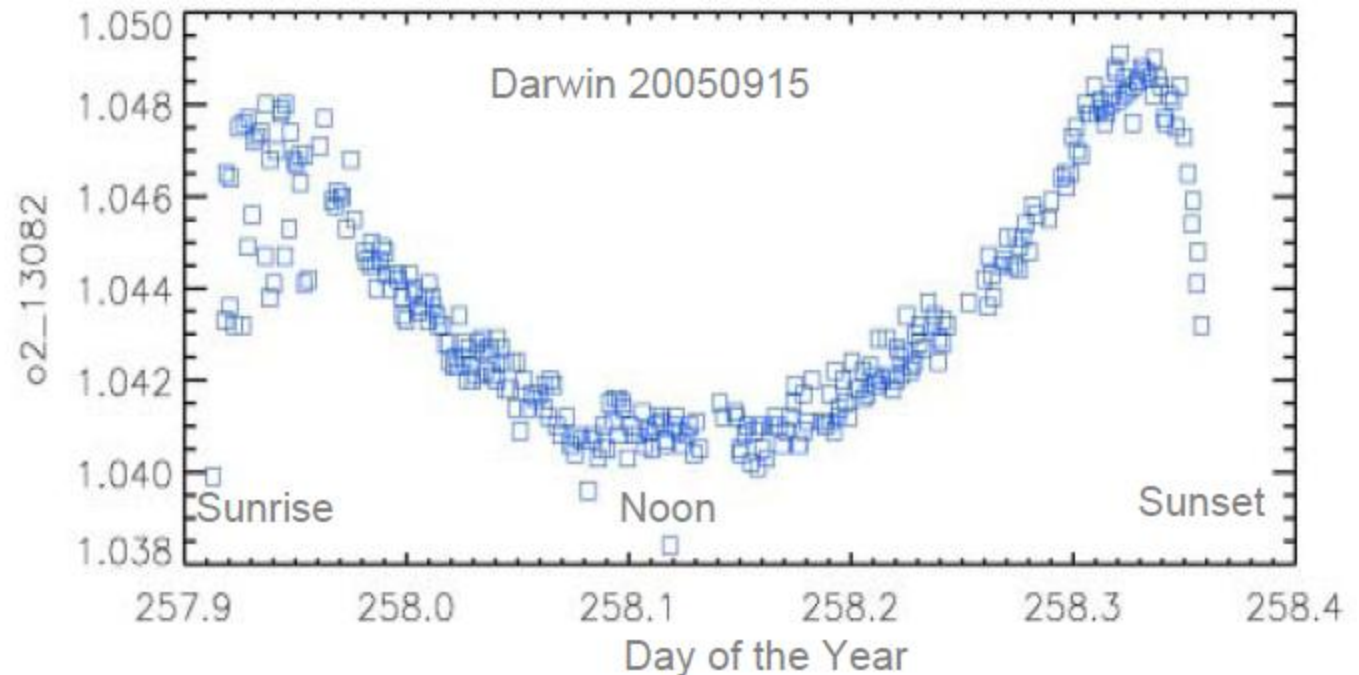

Research Center Karlsruhe, IMK-IFU Garmisch-Partenkirchen

Sussmann et al.: *Validation of SCIA & GOSAT XCH4 by NDACC & TCCON FTS*

Annual cycles: airmass-dependent artifacts – taken from Geoff’s 2006 talk

These artifacts are often quite small (<1%) and can only be seen in data of the highest quality. But they can be an annoyance (e.g. can be aliased into the seasonal variation) and indicate a serious underlying problem.

They are also a very sensitive indicator of spectroscopic deficiencies, assuming that the atmospheric model and ray-tracing are correct.

Annual cycles: airmass-dependent artifacts – taken from Geoff’s 2006 talk

“Unfortunately, virtually all modern retrieval algorithms use NLLS methods, which do not match equivalent widths. Since NLLS methods minimize the square of the residuals, and since the largest residuals typically arise at line center, NLLS methods try harder to fit the line center than elsewhere on the line profile.”

MIR-FTIR XCH4 precision/diurnal variation: impact of regularization?

Zugspitze 2003:
 $AV_i (\sigma_i) \approx 0.5 \%$
variation mainly due to clouds
 \Rightarrow impact of regularization?

L_1 as a function of α (dofs): minimize diurnal variation averaged over all days

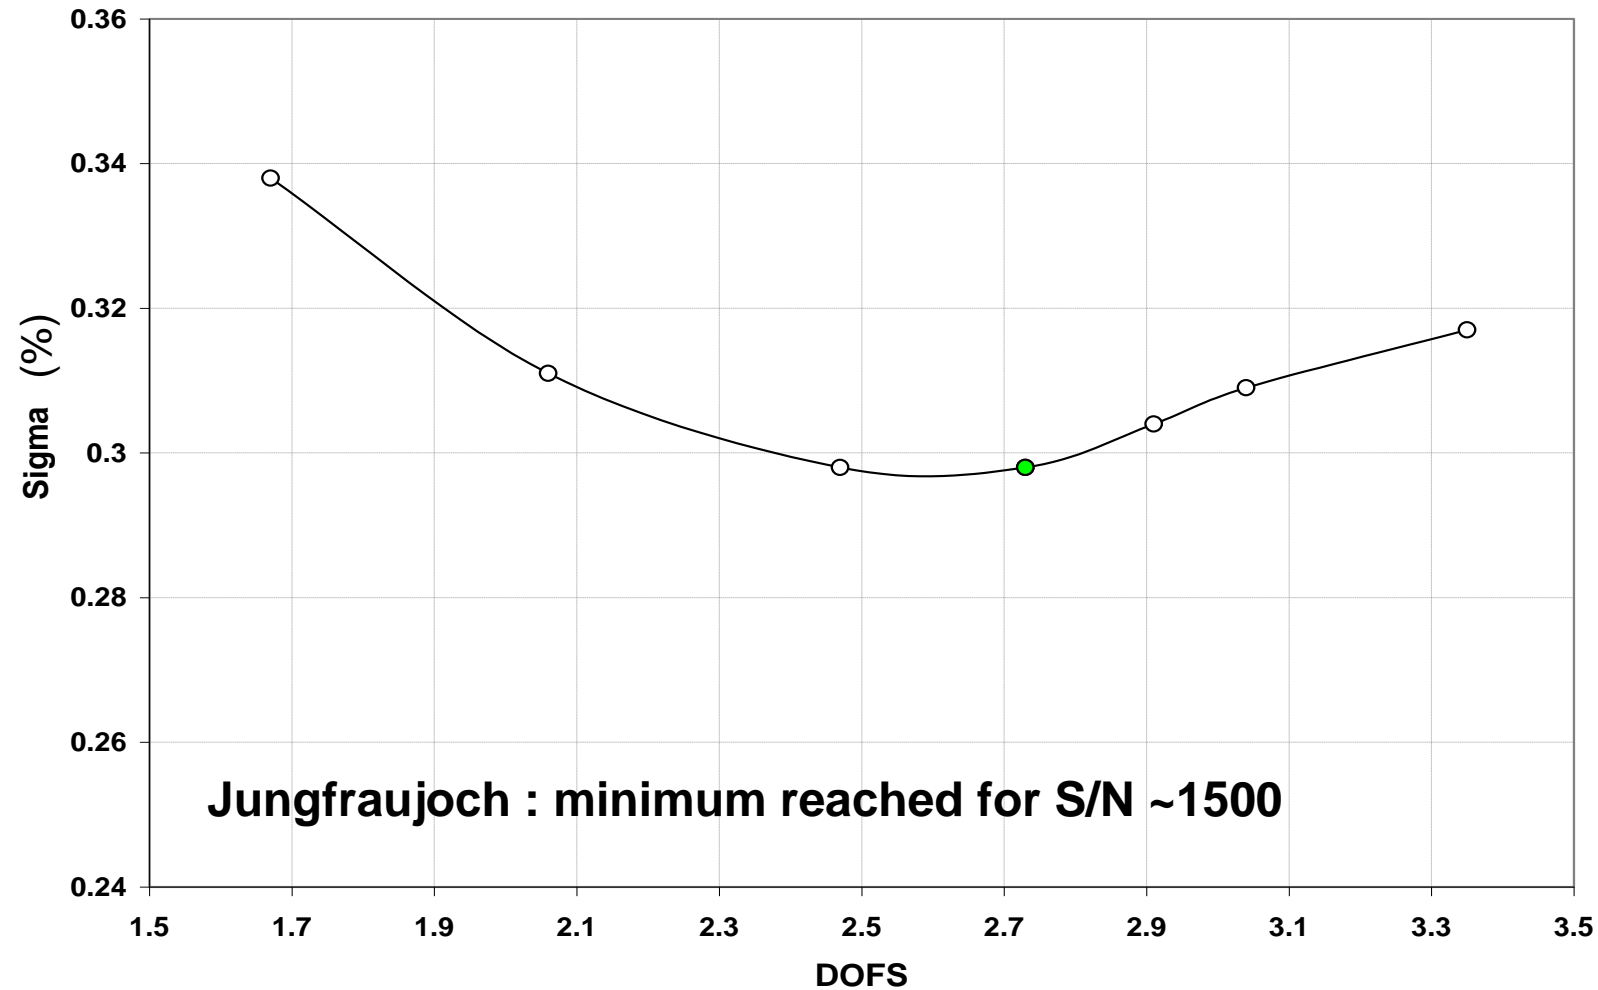

$\Rightarrow L_1$ is robust even for low dofs

\Rightarrow with diagonal S_a (L_0) you can underestimate true variability with σ 's down to zero

Zugspitze result reproduced at ISSJ:

Tikhonov L_1 retrievals optimization: intra-day CH_4 column variability vs mean DOFS

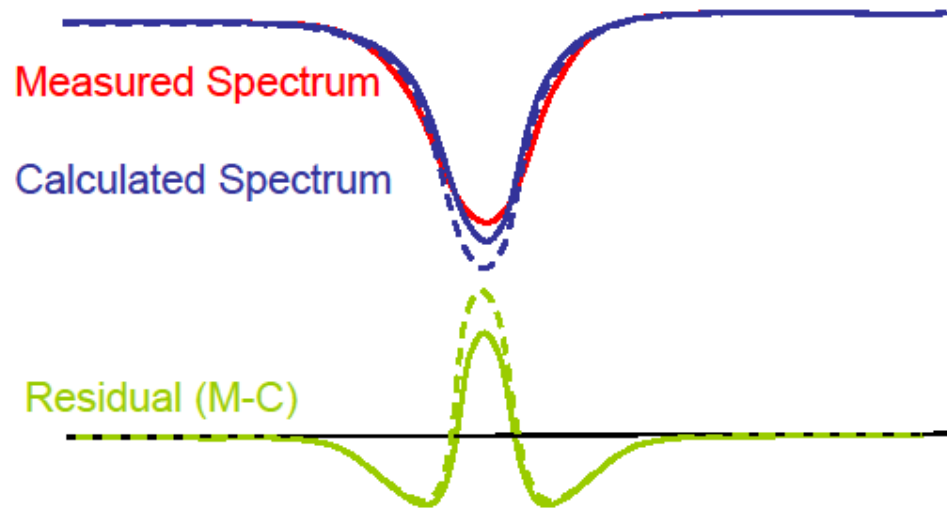

Duchatelet, Oct 2009

MIR-FTIR CH₄ precision: why does Tikhonov L₁ reduce cloud-induced scatter?

“Unfortunately, virtually all modern retrieval algorithms use NLLS methods, which do not match equivalent widths. Since NLLS methods minimize the square of the residuals, and since the largest residuals typically arise at line center, NLLS methods try harder to fit the line center than elsewhere on the line profile.”

Global validation of SCIAMACHY XCH₄ by NDACC FTS – what can we learn for GOSAT validation by TCCON FTS?

Summary

- based on HYMN CH₄ profile retrievals our global SCIA validation study with 12 MIR-FTS stations has lead to a matured XCH₄ retrieval from MIR-FTS which can be used to validate both TCCON-FTS and GOSAT
- XCH₄ annual cycles above clean sites with ≈ 1 % amplitude differ on the 1 % level between SCIA MACHY & g.-b. MIR-FTS & g.-b. NIR-FTS (\Rightarrow GOSAT?)
- GFIT-O₂ compares very well to dry air mass derived from NCEP or in situ p
- CH₄ smiles are reduced with GFIT ver Feb 09 compared to GFIT ver Dec 06
- still both CH₄ MIR and newest version GFIT shows $> \approx 1$ % “smiles“ on some days
- although “precision“ of g.-b. NIR FTS is better, g.-b. MIR is astonishingly good
- CH₄ profile retrieval with SFIT 2 (Tikhonov L_1 on %-VMR scale) helps to reduce cloud-induced scatter by up to a factor of ≈ 3 %

MIR-FTIR regularization: Tikhonov first derivative regularization L_1

$$\mathbf{R} = \mathbf{S}_a^{-1} = \alpha \mathbf{L}_1^T \mathbf{L}_1 = \alpha \times \begin{pmatrix} 1 & -1 & 0 & \dots & 0 \\ -1 & 2 & \ddots & \ddots & \vdots \\ 0 & \ddots & \ddots & \ddots & 0 \\ \vdots & \ddots & \ddots & 2 & -1 \\ 0 & \dots & 0 & -1 & 1 \end{pmatrix} \in \mathfrak{R}^{n \times n}$$

with regularization strength α .

MIR-FTIR regularization: Suggested Tikhonov first-derivative (L_1) regularization

... applied to profiles given in units of %-VMR changes rel. to a priori profile
