### Low-level jet

14.06.2

5

~ . ~

#### Nocturnal low-level jet and the turning of wind direction with height

surface pressure 00 GMT

26 June 2005

asterisk denotes location where LLJ was observed

Institute for Meteorology and Climate Research – Atmospheric Environmental Research

frequency of LLJ over Hanover for 20 months in the years 2001 to 2003

total is 23.17% of all nights

#### circulation types:

BM ridge over Central Europe
HB high over British Isles
HM high over Central Europe

HFZ high over Scandinavia HNFA high over North Atlantic

"efficiency" of a circulation type to produce a LLJ over Hanover for 20 months in the years 2001 to 2003

8

"Grosswetterlagen" (European circulation type)

### **Relevance for wind energy**

#### The vertical wind profile (equilibrium conditions)

logarithmic law<br/>(with stability correction) $u(z) = (u_*/\kappa) (\ln(z/z_0) - \psi(z/L_*))$ power law $u(z) = u(z_A) (z/z_A)^n$ New proposal<br/>(Gryning et al. 2007) $u(z) = \frac{u_{*0}}{\kappa} \left( \ln\left(\frac{z}{z_0}\right) + \frac{z}{L_{MBL,N}} - \frac{z}{z_i} \left(\frac{z}{2L_{MBL,N}}\right) \right)$ needs information on the PBL or mixing-layer height

Gryning, S.-E., E. Batchvarova, B. Brümmer, H. Jørgensen, S. Larsen, 2007: On the extension of the wind profile over homogeneous terrain beyond the surface boundary layer. Bound.-Lay. Meteorol., **124**, 251–268.

Peña, A., S.-E. Gryning, C.B. Hasager, 2010: Comparing mixing-length models of the diabatic wind profile over homogeneous terrain. Theor. Appl. Climatol., **100**, 325-353.

#### LLJ can only be described by time-dependent equations!

subject of this lecture

# Summary

46 14.06.2012 Prof. Dr. Stefan Emeis - Mixing-layer height by remote sensing stefan.emeis@kit.edu Institute for Meteorology and Climate Research – Atmospheric Environmental Research

○ ○ ○ ● RASS delivers temperature profiles, wind profiles are additionally available.
 MLH directly from temperature profiles. LLJ from wind profiles.
 <u>Does not work properly</u> under high wind speeds. Restricted range.

○ ○ ● ◆ wind lidar detects wind profiles, aerosol distribution and water droplets.
 It has to be assumed that the aerosol follows the thermal structure of the atmosphere and the wind.

MLH from aerosol backscatter, wind speed variance, LLJ from wind profiles. <u>Does not work properly</u> in extreme clear (aerosol-free) air and during precipitation events and fog.

Set Ceilometer detects aerosol distribution and water droplets. It has to be assumed that the aerosol follows the thermal structure of the atmosphere.
 MLH indirectly from aerosol backscatter using a MLH algorithm.
 Does not work properly in extreme clear (aerosol-free) air and during precipitation events and fog.

⊙ ● SODAR detects wind profiles, temperature fluctuations and gradients, but no absolute temperature.

MLH indirectly from acoustic backscatter (MLH algorithm). LLJ from wind profiles. <u>Does not work properly</u> under perfectly neutral stratification, with very high wind speeds, and during stronger precipitation events. Restricted range.
