

## **NURESAFE WP1.4 HIGHER-RESOLUTION VVER MSLB**

# **Results for the nodal based scenarios using DYN3D and COBAYA3 (with the compact library)**

**J. Jimenez, S. Sanchez Cervera**

**Presented by J. Jimenez**

- Results obtained for different scenarios with DYN3D and COBAYA3 using the compact library.
- Hot channel calculation using SCF was done.
- Conclusion and Outlook

- **Coupling scripts as well as the input decks have been uploaded in the svn repository and can be found there.** <https://www-svn-corpus.cea.fr/nuresafe/SAT/TEST>
- **All the results will be reported within the corresponding deliverable.**
- **Progress has been done at nodal level and the goals are closer to be achieved:**
- **Pending:**
  - Still some issues with the EXTENDED XS library for DYN3D
  - Coupling of COBAYA3/COBRA-TF.
    - Preliminary results using COBRA-IIIc were computed.
  - Simulation of the proposed transient scenario.
    - Time dependent boundary conditions have been already added to the deck.inp

## **Issues with the EXTENDED library**

- **Before the previous SP1 meeting:**
  
- **New XS library provided (10.2014) for the nodal level. DYN3D needs some modifications in order to read the new library:**
  - Regarding the structure of the XS files, some blocks need to be skipped and some others need to be moved to a different position. There are some magnitudes which have now TH dependence and that needs to be reflected internally in the calls to the interpolators, like Lambdas and Betas. **(Reported by KIT 10.2014)**
  - This implementation work will be done at KIT.
  - DYN3D 2G latest version of the source used in SALOME delivered **to KIT 13.2.2015 from HZDR.**
    - Source revision 818 from svn HZDR repository.

- **After the last SP1 meeting**

- A newer version (v2.04) of the extended library was released (**13.3.2015**) with changes in the format.

- `xs_v2.04_Extended_ntab2.lib`

- 1. The TH dependence is not in the same order:

T Fuel,K	T Mod.,K	Mod.Dens,kg/m3	Boron ppm.
Mod Dens	Boron ppm	Fuel Temp	Mod Temp

- 2. The IDF are now sorted differently, now it comes first all the surfaces for Group 1 and then all the surfaces for Group 2 [S1 (G1 G2) S2 (G1 G2) S3 (G1 G2)]. In the previous file, it was, first surface 1 with the 2 groups, then surface 2 and then surface 3 [G1 (S1 S2 S3) G2 (S1 S2 S3)].

- 3. The kinetic parameters are also changed. Now Betas come before the lambdas and the **lambdas does not have TH dependence but the Betas does.**

## ▪ After the last SP1 meeting

- Another version was released the **19.3.2015** fixing the kinetics parameters. Revision v2.10.
  - xs\_v2.10\_ntab2\_JSe\_sc1.lib
  - xs\_v2.10\_ntab2\_JSe\_sc2.lib
- DYN3D reading subroutines were readapted and first results were produced. Preliminary results were wrong.

Power displaced to the top of the core in the axial layer 29 and 30.

- **Additional WP1.4 meeting in Madrid (19.5.2015)**
- **The 5.6.2015 a new release of the extended library is done**
  - `xs_v2.11_initial_format_sc1.lib`
  - `xs_v2.11_initial_format_sc2.lib`
- **UPM has produced results using the last version of the extended library with and without IDF.**
- **A comparison between COMPACT and EXTENDED format was prepared by UPM and will be presented in this meeting.**
- **Those new libraries in the so called “initial format” are not readable by DYN3D r818 + IQWS 29**

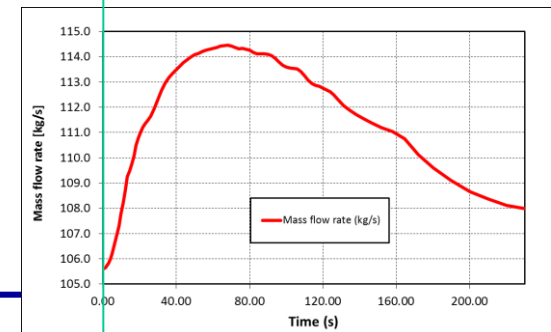

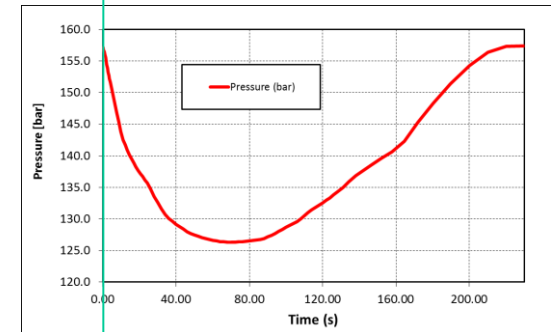

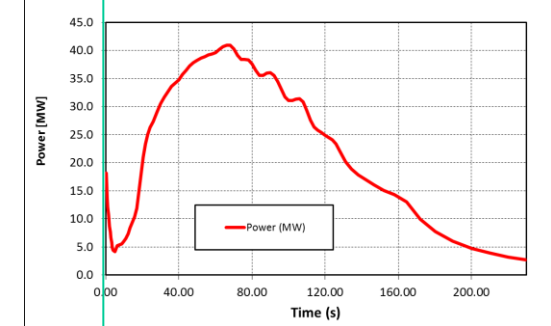

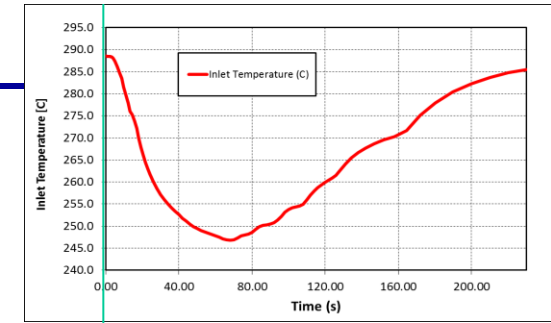

# **Hot Channel calculation with SUBCHANFLOW**

## **KIT contribution at subchannel level**

# SUBCHANFLOW HOT CHANNEL BUNDLE BC PROBLEM

Coolant and fuel Doppler ( $0.7 T_s + 0.3 T_c$ ) temperature

- Good results obtained with the COMPACT format of the library.
- HZP results showed good agreement between COBAYA3 and DYN3D.

## FUTURE WORK

- Re-adapt DYN3D to the new EXTENDED library format and proceed with the simulations.
- Perform coupled solutions for the steady states and transient for both libraries.

**THANKS FOR YOUR ATTENTION**
